very slim, especially in competitive markets such as New York and Los Angeles. Imagine the luckless dealer who has five units on his shelf and one is defective. Any other company will take the computer back and provide another one that the dealer can sell. Instead, that defective unit must be "junked!" and the dealer must "eat" the machine under his 4% discount. Dealers we have spoken to simply will not deal with a policy like that and if they do, they plan to price the 520ST above the retail of $999.95 for CPU and RGB monitor to protect themselves. And we have had confirmation that due to this policy, at least one major distributor has dropped the ST line before it reaches their warehouse."

With the competition that the ST line will be getting from AMIGA, Atari can ill afford such an inauspicious start to distributing the ST line. They need to have distributors knocking at their door, not the other way around.

In article <2585@ut-sally.UUCP> joe@ut-sally.UUCP (Joe Hitchens) writes:
> Does anyone know of a newsgroup (now or in the future) for sources for the
>520ST?

Yes. "net.sources".

There have been several proposals for separate source newsgroups for
micros lately, splitting up so that IBMers, CP/Mers, AppleIIers,
etc can all post to "the right group". Unfortunately, no one
is posting source in noticeable quantity for ANY of these machines.
Splitting off new newsgroups should be done when the old newsgroup
is flooded. Creating a newsgroup won't create a stream of articles
that doesn't exist now.

Why net.sources.mac, you ask? Well, a couple of weeks ago, net.sources.mac
was the second largest group in volume. That's why there is a separate
source group for Macintosh software. Net.sources gets almost exclusively
Unix sources, with occasional Vax/VMS source.
     And sources for ANY other machine simply aren't showing up.

Has anybody seen that 'hex' program that draws honeycombs on the ST screen?
It is a standard demo at dealer's shops and also was in an issue of Antic.
It sure appears to use more than 16 colors, anybody know how? I stared at
the screen in a local computer store and am almost positive that there were
more than 16 colors at once. It didn't appear to use dithering or other
tricks. Anybody know how it is done? Is the 520ST graphics controller
capable of better graphics than advertised?

At long last my fingers have finally been laid upon an ST. It was
a color machine on display at an electronic specialty store called
"Games and Gadgets" in a local mall. (Since I hate malls, this was
clearly a special occasion.)

The quality of the color display was much better than my expectations.
One of our friends remarked "Gee, if I had bought a Mac for $2,500,
I'd be PO'd." Needless to say, we were favorably impressed.

I'd like to offer a few comments which have NOT appeared here before.

1. The space bar suffers from the same problem as the 130XE. There
   is only one key switch and if you are not careful about where
   you hit the bar, you may not get a space.
2. The mechanical mouse felt good and GEM/TOS tracks it quite well.
   Hopefully, some vendor will produce an optical mouse just 'cuz
   I hate anything mechanical.
3. Drop down menus can be a pain if your muscle memory is not tuned
   to the mouse and its scaling. You will sometimes get a menu bar
   when your trying to hit an icon or window corner.
4. A few desktop applications (e.g. calculator) were missing. The
   VT52 emulator was present. The terminal software as shipped
   ->cannot<- select 2400 baud as an option.
5. There did not appear to be a way to drop into TOS command mode
   from GEM. One CompuServe user reported that a COMMAND.PRG shell
   file is required and that file is only available with the
   Atari software development package.

The LOGO was -> quite <- nice. (We are LOGO fanatics around here, but
that could be attributed to terminal burn-out.) It will give you
three windows: text commands, debug and graphics. The debug window
looked pretty handy and is there to give you trace information.
I understand all the standard rationalizations about BASIC, but if
you convince yourself that LOGO is LISP (and it is!) then you can
have tons of fun (without counting ()'s. :-)

All in all, I can't wait until my machine shows up......

POSTING THIS FOR SOMEONE ELSE! DON'T RESPOND TO ME!

From: Victor Frank <FRANK@sri-vax.ARPA>
Subject: CRISMIRE, WHERE ARE YOU? (ATARI 520ST)
Reply-To: FRANK@sri-vax.ARPA

<<<<< PLEASE FORWARD TO USENET (net.micro.atari) >>>>>

I have been waiting almost 8 months for this. Regarding cs2532aa@unm-cvax.UUCP, dated 19-Jan-85, by Ernie Longmire, entitled Crismire Predicts: Atari.

Ernie, perhaps I'm being a bit premature, but I wonder if you could keep an eye on this "Crismire" friend of yours. Just in case he decides to skip the country, that is! There are a number of "Jack" fans out here just dying to see him eat that IBM PC-AT. We could probably find a number of dealers that would love to sell him one for that purpose too.

I have just received a short extra issue of DTACK Grounded. Our friend Felgercarb has just purchased a Jackintosh with Color Monitor over the counter at his local Computerland for $995, and is sending his $300 for a developer's kit to Atari. He may yet find a mass market for HALGOL. There is no BASIC yet for the Jacki.

In peeking under GEM, he finds that TOS (Tramiel's Operating System) is CPM/68K-like. We wonder, could it be that most purchasers will opt to spend an extra $200 for the color monitor, and could it be that a reasonable fraction will ditch the GEM interface? Felgercarb says that 20 mouse operations and 8 disk swaps are needed to copy a disk (single drive, single side). "THIS IS MORE USER-FRIENDLY THAN "COPYAB" FOLLOWED BY A COUPLE OF "Y" RESPONSES TO PROMPTS?"

Is this the next hacker's machine?

Thirty days and counting, Crismire!

Regards,

Victor R. Frank, Editor

I was just told by a very knowledgable friend of mine that the atari ST
can be made to look like any other of the popular 68000 series mainframes,
including the Lisa! Apparently the secret in in the configuration disk,
which has all the appropriate parameters on it for the I/O addresses, etc.
This is apparently a very closely guarded secret at Atari. Anyone heard a
similar story out there?

I had a few problems with using the standard vt52 termcap entry with
the vt52 termulator desk accessory. The main problems were with a
25 line screen and lines longer than 80 columns. Here is a modified
termcap entry which has these problems fixed. I might add that I am
very pleased with my 520ST so far, the monochrome screen is extremely
crisp, even more so than a mac. It seems to be faster as well. There
is not much software as yet, but I knew that when I bought it.

>sounds like a fine machine, and a good value for the money, but it is just
>not in the same league as the Amiga. I am not trying to start any arguments,
> ...

I think your analogy of comparing the timex and pc-at with the
atari 520ST and amiga is a little off base. I have seen a lot
of hype about the amiga, but when I look at the specs the difference
is not that great. I haven't seen the amiga but I am willing to
admit that it is a more powerful machine, because of the special
bit blt hardware and the multitasking os. Where people have to make
the judgement is it worth all that extra money. The bitblt stuff is
great if you are playing games or doing animation but I don't think
it adds much for other applications. Even serious applications such
as cad/cam don't benifit because at the resolutions we are talking
about the 68000 is plenty fast enough. The multitasking feature is a
definite plus, but again here it is not multitasking in the way us
unix users are used to. Since there is no memory management the
programs have to be well behaved and are limited to 32k segments. This
is worse than the ibm pc which has 64k segments but at least has the
option of large model compilers. The ST has the capability of running
this type of multitasking os as well since it's io is asynchronous and
has a prioritized interrupt controller and a dma controller. I imagine
something like OS9 would run very well. The sound issue is a wash as
the amiga has better builtin sound but the ST has integrated midi
controllers into the machine. The ST has as open an architecture as the
amiga through the 1Mbyte/sec dma channel. In fact if we are allowed to
talk about vaporware, atari is planning on an expansion box connected
to the high speed dma channel with better graphics capability and
32bit processors. So you decide if you want to pay $800-$1000 for
an atari ST with a hard disk interface, with midi controllers, equivalent
memory and processor speed to an amiga or pay $2000 for an amiga with
bitblt support, better builtin sound, multitasking and don't forget to add
more money for the hard disk interface, and the midi controllers.

I didn't want to take sides in the ST vs Amiga argument, as I think
the amiga is a nice machine, but it seems that the amiga is being
over hyped both in the press and on the net. For example none of
magazines reviewing the amiga compare features and price with the ST
but only with overpriced products like the mac and the ibm pc.

In article <402@azure.UUCP> michaelk@azure.UUCP (Mike Kersenbrock) writes:
>
>So how do you explain the IBM (PC/XT/AT)?

Simple. IBM has a lock on the office market. Many offices won't buy anything that doesn't have IBM's name on it (living in the unix world biases your perceptions. In the 'real' world, all the money spent on Unix boxes is barely pocket change to IBM...). That creates a strong demand for IBM compatible stuff for people who want to be able to read data but don't want to spend money for the name, and strong demand in the home office market as well since a businessman wants to be able to take his stuff home and work on it... Its amazing what you can do with a product with a questionable price/performance ration if you're IBM...

If you want to look at exactly how powerful the name of IBM is in the office marketplace, look at the PCjr. Without the political power of the IBM name in purchasing offices, the machine flopped, because it couldn't compete in an open market. The real advantage IBM has is that its market ISN'T open...

Here's another vote for net.micro.ST.sources. I've had my ST for a week now,
it is time to get busy getting programs running on it.

   I was one of those Atari enthusiasts that bought the 800 when it cost
a bundle. I have never regretted it since! It was a landmark machine in
graphics (price/performance) and in operating system software.

   But as we all know, the designers of that system left Atari. Instead of
a second generation of graphics architecture and obvious computer group
upgrades in processing power, memory, and mass storage, Atari merely
repackaged the same product a few times (many of them unsuccessful). They
didn't even bother to increase players and missles and playfields.

When Jack T. revived Atari, I once again hoped that new architectual advances might happen (special graphics processors, etc.) Although I presently own neither an ST or an Amiga, it sure looks to me, from the technical descriptions I have read, that the only thing "Atari" about the ST is its name. The Amiga, I believe, is the "Atari" that I'm looking for.

If this is really the situation, I suspect that this newsgroup will change its name. Anybody agree/disagree ??

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
From **RJE** Thu Aug 8 10:57 CDT 1985
>From **RJE** Thu Aug 8 10:57 CDT 1985 forwarded by **RJE**
>From rtb Thu Aug 8 10:53 CDT 1985 remote from ihlpm

I wandered into the local computer store the other day and they had an Atari 520-ST on display. I got to play with it for about a half hour. Here are some things I found out, and some of my first impresssions.

*The initial models being shipped are CPU (with built in keyboard),1 Single sided 3-1/2 inch drive (seperate from CPU), an impressive RGB monitor, and a mouse for retail $995. This was a suprise for me because I thought the first drive was built into the CPU. The storage capacity of the drive is 360k. I don't know why they aren't selling Double Sided drives with a capacity of 720k. I think an after market outfit will start making these pretty soon, unless Atari starts coming out with them.

(One of Jack Tramiels favorite tricks is to keep his customers
coming back for more, i.e. sell only single sided drives this year and
then come out with double sided ones next year, eniticing people to
upgrade systems they are already satisfied with).

* Additional drives are $200 apiece

* The computer has 1 serial and 1 parallel port built in.

* There is a hard drive port built in. A 15 meg hard drive
  will be available for about $400-$600.

* GEM is about what I expected. Pretty much of a Macintosh clone.

* The keyboard's feel is pretty good, what I would expect for
a machine in this price range

* I don't think you can pop out of GEM into a command driven OS at this
time. This is a disappointment to me as I personally can't stand
mouse and icon type OS's.

* The machine is being shipped with LOGO, and BASIC will be supplied free
when they get all of the bugs out of it. I thought the LOGO was pretty slow
for a 68000 machine running at 8 megahertz.

* The machine is faster than the Macintosh (except for LOGO, if there is
LOGO available for the Mac I can't imagine it being any slower)

* There is a VT52 emulator as part of the OS, a big plus for me

Over all, I was very impressed with the machine on a price vs. performance
ratio. I can't imagine why anybody would buy a Macintosh when they
can buy a faster color machine for $1000. The isn't much (any)
software available yet. But what is promised looks really good.

for example:

A 1-2-3 like spreadsheet for $100
A C Compiler for $80
Atari is promising a lot of software at very affordable prices.
(Personally, I think the best way to fight piracy is affordable software)
(I hope OSS will get on the ST520 bandwagon because I always liked
  their software and their way of doing business)

I don't own a computer right now, but I have owned 2 in the past.
I use a computer about 50% of the time as a terminal emulator, 40%
of the time for games, and about 10% for programming or hacking.
I don't like having a big part of my capital tied up in home computers.
Based on my past experience, this is most likely the computer for me.

The floppy on the ST is still serial, so unless you reproduce the analog
board, you can't hook up the parallel drive to the serial connector!

When I bought my 520ST, the dealer mentioned the avilability of the C
compiler from Haba Systems in Van Nuys, CA. I had a couple of tech questions,
so I called them. Apparently the tech support is up in Sunnyvale,
(408)731-1200.Hippopotamus software did the compiler, as an offshoot of their C
compiler for
the Macintosh. I finally got through to some nameless person. He said that
version 1.2 has not been shipped yet, but did answer a couple of questions.

Apparently the compiler package does not include a debugger, or any kind of bounds checking. The compiler runs in supervisor mode, but nobody seems to know if the generated application program does or not. This is important; how would you stop your undebugged program from crashing the system, or find out where the offending line of code was?

I also was curious as to how you might write interrupt-driven code and connect it to the interrupt vectors. Can the C compiler generate re-entrant code for interrupt service routines? Nobody around there could tell me. I got the impression
that their tech support on this product is going to be minimal. The low price does not make up for the trouble you can get into by not being able to get answers when you need them. Perhaps a more expensive product with better tech support and debugging aids would be a better choice.

Some talk has been going around about making a net.atari.st.sources.... newsgroup. Until net.sources gets overtaken by ST software, I shall assume that net.sources will be a good place to post. As a courtesy to non-atari readers of net.sources, indicating ST-ness of the source in the subject field would be a good idea.

Anyway, there is some neat fractal stuff that you can try on your ST if you have the DRI development system. I got it from someone at our user group with no restrictions to redistribute.

You will find it in net.sources (where else?)

Two problems I'm having with ACTION!:

1. When using GetD() I am intermittently getting garbage!

```
Open(2,"K:",4,0)
xyz = GetD(2)
(xyz contains random numbers from 0-255 even though
 the same key is hit on the keyboard)
```

    I've tried just using IOCB #7 (ACTION!'s default input channel)
    and other tricks but to no avail. The thing that really makes
    me crazy is that it works fine until I edit the source file or
    do some other equally obscure thing and it breaks until I edit
    the file some more!!   Maybe I should have used BASIC after all...
    Or could this be a CIO problem??

2. I've also had problems using Locate() (occassional hangs, bad
    data returned, etc. Anyone else had these problems?

Applications?????

Is there anyone on the net who gives a tinker's damn about applications?

The important thing is to have a 68000 CPU and nifty specs for sound and
graphics. It doesn't matter if you ever *use* that stuff or not.

Besides, hopefully someone will put Unix on an ST or an Amiga. That's
another important thing to have, even though you have no use for it.

>The multitasking feature (of the Amiga) is a

>definite plus, but again here it is not multitasking in the way us
>unix users are used to. Since there is no memory management the
>programs have to be well behaved and are limited to 32k segments.

Not true. Programs can be arbitrarily large (since addresses are relocated
at process startup time) and they don't have to be well behaved
(since address faults, etc are trapped on a per-process basis).

I got this information from one of the people who designed the Amiga's
multitasking operating system. All in all, I was very impressed
by the number of things that they got right.

The August issue of Antic has a picture of the ST motherboard and a VERY
brief description of some of the chips on it. Does anyone have any more
information on this? In particular, it mentions the CPU as being an
68000P8, what does the P8 mean? Also, it says there is a screen controller
chip or something like that, which is suppose to off load the 68000. Any
more info on that chip. Finally, there is a DMA chip, but someone stated
in this newsgroup earlier that the floppy used a serial interface, is this
correct info? The biggest shame about the ST is that it didn't get written
up in very good detail even in a magazine devoted to atari computers...

>review.)

Yes, it's possible that BYTE will review the 520ST in 3 or 4 months,
but there is also a chance that the machine will never be reviewed.
This is my opinion because I have never seen any (!!!) note on the
new ATARI super-pc in the BYTE magazine (not even in chapters like
"New Products" or "Nanobytes"). I still think Byte is negoitiating
the 520ST and I'm still intersted in rumours and opinions about that.

Xref: watmath net.micro:11975 net.micro.atari:1130

Somewhere not to long back I read that the ST had an industry standard FASI(?) hard disk interface. At the time I passed it off as being a typo meant to say SASI. However, after staring at the pinout for a while, I realized that the intended interface was some sort of parallel interface with DMA capability and that the lines available were actually processor bus lines. Since they provide only one address line, and only eight data lines with no UDS or LDS, I assume that their can only be two I/O registers. The port configuration looks very similiar to what the NCR 5385 SCSI protocol controller chip provides but without enough address lines to get at the full set of control/status ports. Anyhow what I was wondering ...

1. Does anyone know if there is such a thing as a FASI interface, and if so where can I get information on it? (Any leads at all appreciated.)

2. Does anyone know what is inside a developers hard disk. If there is a certain chip (or chips) that is being used to talk to a standard hard disk interface (Xebec, or SASI) ?

3. Do any of the software developers know what the format of the hard disk registers are ? (If the format is simple enough this could help alot.)

4. Basically any information at all about this hard disk port on the ST would be appreciated.

The end result of this all is that I am trying to hang a hard disk on this monster that I already have.

Pin out of the ST Hard Disk Port.

1 - Data 0 2 - Data 1 Pins 11,13,15, and 17 Ground
3 - Data 2 4 - Data 3
5 - Data 4 6 - Data 5
7 - Data 6 8 - Data 7

9 - Chip Select (Probably Decoded Inside the ST to select the interface port.)

10 - Interrupt Request (Probably an interrupt to the 68000)

12 - Reset (Probably a reset signal from the 68000)

14 - Acknowledge (Probably a DMA data acknowledge signal)

19 - Data Request (Probably a DMA request to the DMA controller in the ST)

16 - A1 (Probably an address line that selects between to registers on the interface port chip(s).)

18 - Read/Write (Probably processor and DMA generated read/write signals)

Lately, I have seen some nice desk accessories, games and even
applications being posted to the net for the mac. I happen to
have an atari 520ST and would like to have the source to these
programs posted as well if possible. I am sure the amiga users
would concur. I for one would rather see more interchange of
information than barriers being raised by statements such as
"My machine is the best". A lot of public domain software is
available for the mac today, but I imagine that ST users will
soon be contributing as well. I also feel that there is great
learning value in seeing the source code for a program rather
than just using it.

In my (long and tedious) search for a local ST-520 dealer, I came
across a soon-to-be Amiga dealer. His customers have seen ST-520s
in Macy's in New York City.

Can anyone confirm this? ST-520's in department stores would be a
death blow to Atari's chances of finding "serious" dealers (ones who
are willing to service the machines.)

Well, I finally found a ST-520 dealer. I'm not impressed with him,
anyway. He claimed to have only one demo disk, he wouldn't let me
put it in myself, and when my nine-year-old tried printing the screen
and halted the machine, he took the demo disk out. He didn't seem too
big on answering my questions, such as "Can you get a second disk
drive?" and "Do you know when GEM Write will be available?" (Yes and
no, respectively.) He seemed to think that the only software currently
available, aside from GEM itself, was some Infocom games.

So, two questions. First, does anyone know of any other ST dealers in
east central New Jersey? (If so, or if you want to know where this guy
is, *MAIL* don't post.)

                  ____ ________ ____ ___ ____
More importantly, what software have you seen on shelves or in your
hands? Announcements, advertisements, and assurances of "Real Soon Now"
don't count. (Neither do beta test copies.)

*** REPLACE THIS LINE WITH YOUR MESSAGE ***

Calls to Atari distributors also revealed the following (if you haven't
bought your ST yet.

You can get the ST, Mono, Color, 1 single sided drive, 1 double sided drive
for around $1500.

You can get the ST, Mono, Color, 1 single sided drive, 1 hard drive for about
$2400.

One mail order operation has been buying the "big package" and selling the
pieces.

Caveat - Atari has a strange return/warrenty policy. The warrenty is
provided/sold by the dealer. Local dealers provide it free, but are under
no obligation to do so.   I am told that this policy may change soon.

From what I understand, the new Atari has been carrying on the old
Commodore tradition of being relatively unfriendly to the press &
software developers (note high price on the pre-release developement
kit....it required a major investment from people who didn't know
how tha merket was going to go). BYTE gets information sent to it
more than it goes looking for it.....they get more than enough info
that way that they don't HAVE to go looking...they have more than they
can handle as it is (note the 3-4 month lag time). If Atari sent
them a machine, they would review/preview it....if they (Atari) DON'T
send a machine for review, the review will have to wait until BYTE has
a bit of slack in the material available to it.....don't blame BYTE
for Atari's PR faults.

              -Richard Hartman
              max.hartman@ames-vmsb

(P.S.: I am a definate Atari fan, however I think Tramiel is making som
        misteaks about publicity here....I think he is deliberately
        ignoring magazines, except for the ones that order the
     developement kit themselves (Analog Computing did that). He
        needs to go out & VOLUNTEER information, and he doesn't like
     doing that.

Before I get fried for mis-information, the 2 drive is $1700 and the
Hard-drive version is $2500.

The hard disk is the Haba drive not the Atari low-cost drive.

With all the options, buying an Atari will be like buying a component stereo.

Dealers seem to be a little upset with Atari. No matter how hard they try to sell the higher profit machine, people buy the Atari. One dealer has sold out three times. The problem, he's got 128's for the same price.

Since dealers seem to be sadly lacking in imagination, let's give them some help. Show them Ravi's 1meg upgrade. Maybe they will show a little more enthusiasm if they can charge $150 for $6 in parts and an hour's work.

Any info on EXTERNAL ram upgrades?

Does anybody know of a device for interfacing STANDARD disk drives to the Atari? Hard disks? I know the ATR 8000 allows normal disks to be attached to the Atari, but it also provides a number of other features & I don't particularly want to pay for features I don't intend to use.....

-Richard Hartman
max.hartman@ames-vmsb

P.S.: for that matter, is the ATR 8000 still available? Would anyone want to sell a used one?

A local dealer needs help.
He has been trying to get some software on his shelves for the ST for
about three weeks. He is getting a lot of 'Real Soon Now's but nothing
for his shelves.

Can anybody give me the names of some titles he can get right now?

The product should be something which you can buy now, the magazine ads
haven't yielded any thing but some text adventure games.

If you have purchased the product, please describe your impressions of it.

If you have seen demonstrations, please describe your impressions.

If you have written 'public domain' stuff, would you be willing to have
it sold?

No "Demo's", there are enough of those included already.

Most urgent needs are some sort of communications package with binary
download capability.

Unfortunately, many sites also restrict accessability. (Developers doing
System 5 work can get in trouble for reading net.sources). Other problems
include security of calling out (got a phone # to SIMTEL-20?).

The explanation for this was that source posted to net.sources was public
only to berknet users. How public are net.sources?

Some Sites, (Europe...) don't get them at all.

Post here and include net.sources in the newsgroups.

Shall we vote?

Well, I have personally seen:

Mark of the Unicorn	MINCE (editor)
" " " "	PC/InterComm (VT100 emulator)
" " " "	HEX (strategy game)
Batteries Included	??? (a.k.a. "Hud-Draw") (paint program)
Haba Systems	??? (checkbook program)
???	Sun Dog (graphic exploration game)
InfoCom	Hitchhikers, Zork I, ???(their latest one) (text game)

I only know for certain that the Mark of the Unicorn products are
actually available in dealerships, because I work for them. But the
others looked real and ran properly in the demonstrations I saw.
(The "???" mean I don't remember the name, not that they are un-named.)

>There is an ad in the October Issue of Analog Computing for a company
>called Gizzmoz that are selling things for the ST already.

I called Gizzmoz, and was told that : "Atari has changed their
policy. The Developer's package is available to customers through
Atari only." She gave me some details on what it was (like all the
other summaries on this newsgroup), and told me to call Richard
Frick, at Atari: (408) 745-4926, if I wanted to buy the developer's
package.

The woman at Gizzmoz was quite helpful, and provided far more information
about a product Gizzmoz doesn't sell than some places do for products
they *DO* sell. Good for her!

This is a summary of some notes from Compuserve.

The 520 can be upgraded to at least 2MB internally (all decoding is in place, etc.). With extra decoding and improved cooling you could reach 15MB. However, GEM would probably have to be modified to know about more than 2MB. There will be a 1MB expansion board announced in about a month. I think that the company is called "Dynamic Software Design".

My understanding is that GEM does not replace the operating system,
but instead provides a common library of window management functions.
(It may also provide a common interface for the basic operating
system calls.) When you run GEM on an IBM-PC, you are using a
different OS than when you run it on an Atari ST.

For example, if the underlying OS only provided for 8-character file
names, then icons could only have 8-character names. If the OS
allows file names with spaces in them then icon names can have spaces
in them.

 The color monitor shipped with the st is an RGB only monitor. It has a
special (i.e. non-standard, not a small D) connector. I think it will be
difficult to attach a composite video monitor since you would have to go
from RGB to composite... By the way, the video on the 520ST is the cleanest
I've seen in a long time.

I finally got through to the "official" Atari BBS, run out of
Atari headquarters in Sunnyvale. (I got the number from
Creative Computing's Atari olumn a couple months ago).

There is some good news & some bad news.

There are now three lines operating. Each has a seperate number,
but a call to line #1 will try to use line #2, if #1 is busy, if
#2 is also busy then it will try for #3. I do not know if the other
two numbers contain automatic "try-the-next-line" features.

Line #1 & #2 are on Atari 800s w/ Corvus hard disks (using joystick ports 3 & 4 for the interface) (I still don't know where to get one though), line #3 is a 130XE with two double density drives. This means that three is slower AND THAT THE MESSAGE BASE IS SEPERATE FOR EACH LINE! They want to see if they can get something to allow one machine to use more than one incomming port....

Their official line is that they will carry PD software for the ST line as it comes available....they say that stuff for the 8-bit machines is already available on other BBSs. I left a note saying that a little "offical" support would help us feel a little less abandoned ("us" being the 8-bit owners). I suggest that others feeling the same way call & leave similar messages.

Each line has 1200/300 baud modems, so you can call w/ either. It detects ATASCII/ASCII on the first <CR>, and there is no facility for telling it otherwise after you are logged on. I don't know if there is a real advantage for using ATASCII, some BBSs use the special graphic chars if they know that they are available.

I will post the numbers if there is enough interest.

If this is Atari's new approach to selective dealers, lets go back to
selling through Toy'R'Us. There you can get a good price, take the machine
home, play with it a couple of days, and , IF YOU DON'T LIKE it, take
it back for a complete refund (try that with a "full-service" dealer).

I haven't yet found a computer dealer worth his commission.

A compendium of INFOWORLD reviews----

Atariwriter is adequate for casual word processing, but you can't use it
to write documents larger than your computers's memory or to display
more than 38 columns.

Bank Street Writer is an excellent word processor for beginners. Its use
of three operational modes makes learning the system easy. That same
three-mode structure can hamper the editing process however, and if you
tend to edit documents heavily this word processor probably isn't for
you.

Letter Wizard is an easy-to-use word-processing program. You can use it
to create custom form letters, and you can do this without having access
to a data base. Printing columnar information may give you some
problems, however - you can't preview the final printout on the screen
and the text screen is set in 40-column format even though most printers

print in an 80-column format.

Homeword is an easy-to-use word processor for Atari systems. Its use of icons makes it simple for novices to understand and use, although more experienced users can bypass the icons and use command codes. This is a good program, but it does have one limitation - you can only store documents that are up to three pages long.

Super-Text--If you have never used the Apple version of the Super-Text word-processing program, you won't know what you're missing in this Atari version. This program lacks the math and form-letter capabilities of the Apple version, and it ignores the Atari's special operating features. Unless you are already familiar with Apple Super-Text, you will probably find this program cumbersome and difficult to use.

Letter Perfect - contains many features that are usually available only on more excpensive dedicated machines. It can perform almost any word-processing task well, although its complexity may make it difficult to learn to use if you have no prior experience of either word processors or computers.

Most of my experience has been with Letter Perfect and I would second JRCooper's comments. I have used it for lengthy documents as well as everyday letters and have found it quite satisfactory.

Actually, 1-2-3 does run off the shelf on the sanyo 555 with a sanyo
video board that costs about 200. In fact, so does gem if you change
4 bytes in memory. I have run GEM draw on a sanyo 555 vb with 512K.

Other than this tiny point, I think this is a great article.

I was pleased to see Atari ST software available in the local "Program Store".
Not much, but they had single copies of a few items on the shelf and were
hoping for more in this week. I didn't write down the names of the products
I saw, so this is from memory (a few parity errors).

1. HEX - A game from Sign of the Unicorn. You control a Unicorn
   which is hopping around on a hexagon of hexagons. There
   are opponents (jellyfish and the like) which are competing
   for the hexagons against you.

2. A Terminal emulator program (cheap and simple). I think it was
   a VT100 emulator. Looks like it was produced by a smaller

concern judging by the lack of glossy packaging.

3. A really fancy communications package. Expensive, around $120. May have also been from Sign of the Unicorn. Has a terminal emulator, communications protocols (KERMIT, XMODEM, capture mode, all the good stuff).

4. MINCE - An emacs-like text editor. Around $120-$15 I think.

5. ZORK I, Infocom. Don't recall the price, but I think it was about $40.

/* Written 11:02 pm  Sep 15, 1985 by psc@lzwi.UUCP in uiucdcsp:net.micro.atari */
/* ---------- "First look at ST-520 (any software" ---------- */
Well, I finally found a ST-520 dealer.  I'm not impressed with him,
anyway.  He claimed to have only one demo disk, he wouldn't let me
put it in myself, and when my nine-year-old tried printing the screen
and halted the machine, he took the demo disk out.  He didn't seem too
big on answering my questions, such as "Can you get a second disk
drive?" and "Do you know when GEM Write will be available?"  (Yes and
no, respectively.)  He seemed to think that the only software currently
available, aside from GEM itself, was some Infocom games.

So, two questions.  First, does anyone know of any other ST dealers in
east central New Jersey?  (If so, or if you want to know where this guy
is, *MAIL* don't post.)
                  ____ ________ ____ ___ ____
More importantly, what software have you seen on shelves or in your
hands?  Announcements, advertisements, and assurances of "Real Soon Now"
```

don't count. (Neither do beta test copies.)

In article <255@ccivax.UUCP> rb@ccivax.UUCP (rex ballard) writes:
>Most urgent needs are some sort of communications package with binary
>download capability.

I called Atari, and they claim that they are shipping Kermit with
the C compiler/assembler/linker package. I don't know if this
version can do binary downloads or just 7-bit, and don't much
care, as so many mailer systems chew up 8-bit files. A version
of the binhex 4.0 protocol (Macintosh 8-bit to 7-bit file coding)
would be nice....

("What's this Kermit thing?". Kermit is a communications protocol
developed at Columbia University to facilitate transmission of text
files between mainframes and micros. Many versions support 8-bit
file transfer. It has good error-checking, although it is slow.
     Kermit is available for damn near everything: if
you want your Cray-1 to talk to your Commodore 64, they both speak
Kermit. Kermit is available through many user's groups. Columbia
U. will NOT supply disks with Kermit on it to people. They do
sell tapes with the entire Kermit collection (mainframe and micro),
if you need to bootstrap it. okstate and cu20b have Kermit online

in various versions for uucp and ftp, respectively.)

Date-Received: Thu, 19-Sep-85 05:48:16 EDT
Distribution: net
Organization: AT&T Bell Laboratories
Lines: 57
Xref: watmath net.micro.amiga:164 net.micro.atari:1141

Let's look at few facts on the ST-AMIGA comparison.

Software: There is software available for the ST right now.

1. Developers kit with C, assembler, linker, CP/M 68K,
   2000 pages of documentation. $300 (how much do you
   think Lattice C for the AMIGA will cost?)

2. PC Intercom. A complete terminal program with VT100
   emulation, 20 programmable function keys, download
  and upload capabilities.

3. Express. A complete word processor with a download-
   upload bare-bones terminal emulator included. Price $50

4. Ram disk program from Michtron $35

5. Wishbringer from Infocom

6. FORTH-83

7. HEX a real-time graphics game

8. MUDPIES another real time graphics game.

Hardware: Why is everyone calling the ST a closed machine and the Amiga an open machine? Both are coming out with expansion boxes that have slots for expansion boards. If the AMIGAS expansion box was already available (or the AMIGA and the expansion box where available) THEN you can say that the AMIGA is more expandable

IT will cost more to upgrade the AMIGAS ram because the AMIGA uses expensive 64k by 4 chips instead of cheaper and more available 256k by 1 chips. There is already a way to expand the ST to 1 meg for just the cost of 16 256k by 1 chips.

Many reports haver stated that the 600 by 200 text mode looks better on the ST than the AMIGA. If you don't like the text on the AMIGA you are out of luck, you can't put a monochrome monitor on the AMIGA that is as sharp as the ST monochrome system. You can get a monochrome monitor for the ST (the ST has a 600 by 400 mode) that has better resolution than the MACINTOSH Monitor.

The CD ROM for the ST is an exiting product. If you think that they are only going to use it for an encyclopedia you are mistaken.

Who cares that the AMIGA has Sprites and the ST doesn't. Programming Sprites is a pain in the neck, and bit-blit graphics (which both the ST and AMIGA have) is a better way to go.

You will note that in all these comparisons I tried to keep the issue of price to a minimum. I am sick of hearing that the AMIGA is better but the ST is cheaper. I guess that the only thing that both AMIGA and ST fans will agree on is that the next year will be an exiting one.

    Subject: Haba Soft- and Hardware.
    Last ANTIC or ANALOG magazine an ad from HABA promised many
    fine things: a hard disk, a C-Compiler and much more. Does anybody
    know, whether these things are already availible or not. Please
    send mail to
                Uwe Hoch (...ihnp4!hpfcla!hpbbn!unido!uh)

A couple of weeks ago, Haba had a seminar on software development for the ST in which they offered development systems for sale. These included prototypes for their hard disk. I spoke to them a week ago, at which time they said that the disk would be out in about two weeks. So I guess it should be out REAL SOON NOW...

More importantly, what software have you seen on shelves or in your
hands? Announcements, advertisements, and assurances of "Real Soon Now"
don't count. (Neither do beta test copies.)
--

My local dealer has had the Express package (a primitive text processor/
terminal emulator/whatever) for a few weeks. They got the Infocom stuff
in about a week ago, along with a version of the Mince text editor.

520ST software that I have seen in stores:

    From Mark of the Unicorn:

        MINCE   emacs-like editor
        PC/Intercomm VT100 emulator, xmodem, kermit, etc.
        HEX   arcade like strategy game

    From Infocom:

        Wishbringer   adventure type games
        Zork 1
        Hitchhikers Guide to the Galaxy

    From Mirage:

        Express   simple word processor, mailing list,
                 mail merge, etc.

    From Michtron:

        Mudpies   arcade like game

From SST Systems:

Chat simple terminal emulator, xmodem

I also saw a note on the Compuserve Atari SIG last night that some stores have started receiving the Haba C compiler in the last day or so.

(Without including the previous messages here....briefly this
 was a discussion of the Amiga's OS being on a kickstart disk
 instead of ROM. Someone thought they were taking the cheap
 way out, the other person seemed to think it was good for
 OS updates. (I don't really know why this was on info-atari,
 but I am interested in both machines and will reply anyway))

There is another reason for the Kickstart disk approach. In the
latest Compute! (wait a bit for it, if you don't have a subscription)
they mention that Commodore has made the Amiga IBM compatible COMPLETELY
IN SOFTWARE! Try doing THAT with a burned-in OS!

Just read in InfoWorld that Atari is going to offer a second operating system for the 520ST. Since I've been pondering the purchase of either an Amiga or a 520 (after Hanukkah), I was really excited when I saw the headline.

I should have taken a cold shower.

Atari is negotiating with a British company for something called BOS. Apparently, it is somewhat popular on the continent among business users. Atari wanted something to increase the acceptance of the 520 as a business machine both here and there, hence BOS. There are several business applications available for BOS, and Atari wants to port these over. Eventually, BOS will be thrown in with new 520 purchases; current owners will have to shell out $100 for BOS. Oh, yes, the BOS application programs are in the $500 price range (yikes!).

(** flame **)

Once again, another computer company is stumbling around without clear goals. Who in the hell is going to buy an ST just to get to run BOS programs? Why couldn't they just buy something like CP/M68K or maybe OS-9? I'm not fond of the Amiga emulating a PC and running MS-DOS, but it makes a lot more sense than this BOS nonsense.

Oh, well. The Atari just dropped another couple of notches relative to the Amiga (in my opinion).

I just bought a 600xl with 64K of RAM. I did NOT buy a disk drive or
cassette drive: if I were to spend serious money, I would want to get
a serious machine. But I can't resist hacking on the new toy. I am
thinking that I might try to make one of my other computers simulate
a disk.

I understand that the disk port is really a 19.2K Baud serial line
at TTL levels (not RS232C levels).
- Is this true?
- What protocol is used to talk to the disk?
    - Is it asynch or synchronous?
    - What is the structure and meaning of the info transferred?
- What are the pinouts? (By the way, what are the pinouts of
  the other connectors?)
- How much disk support is in the ROM? On a DOS disk?
- What is the cassette interface: would it be easier to simulate?
- How does my 600xl differ from an 800xl?
- (Most important): what are good sources for this information

(books, specific magazine articles, ...)?

The September BYTE article on upgrading to 256K RAM and the RAM-disk
software (posted by ihnet!bryan) contain some hints.

>
Other Reviews of the Atari 520ST are in:
Creative Computing (10/85) - 5 pages with many photos
Personal Computing (10/85) - 2 pages

The overall comment is that the Atari ST is powerful for its price, but the
lack of available software is the main complaint.

I'd have to agree - nothing beats being able to try the machine
out for a few days knowing you have nothing to lose if you are
disappointed.
     Also, I don't know why Atari bothered to make a special version
of the machine for the mass marketers, why not just sell the same
520 ST as the computer stores?

The number published in the Outpost Atari column of Creative Computing
a couple months back is:
     408-745-5308

This number will connect with the any of the three lines, depending
on which is available.  I got #3 with it when I called.  I lost the
paper on which I noted down the direct numbers for #2 & #3, but they
are available on each of the machines they have there, & this number
will give you three chances at a connection.

Please gripe about their lack of support for the 8-bit machines,
they just want to post ST stuff as it becomes available....

What does Mr. Franklin mean by "the millions" of CP/M-68K programs out there?

CP/M-68K is the new 68000 mpu (hence 68K) version of CP/M, or an MS-DOS
hybridized son-of-CP/M. Is it true that CP/M-68K programs are actually out
for machines other than the ST? I've never seen any myself, so I must
wonder. And would they be at all compatible with the ST?

A totally unrelated question:
 Please be subjective: What is (barring price) a better deal- an ST or an AMig

Haba expects to ship the C compiler "real soon".
The software is copy protected, but it will run from any drive, as long as you have the original floppy in drive A: when you start the "shell". Once the "shell" is running, you may remove the Haba disk from A: and stick anything else you like in it. The whole system comes on a single diskette, including the editor program, compiler, library and linker. The editor is screen oriented, uses the F1-10 keys, but no cutsie mousie stuff. One window, one file (You may read other files into the buffer, delete the stuff you don't want, etc.).

They are also shipping the 10M hard disk for developers. $799, but has a heavy duty everything. The consumer version will be ready in a "few weeks", and will be $650 - 699. Same size (10M), but half the size of the developers' version. The man said that the developers' version was designed to take more abuse, constant running, and so on.

Xref: watmath net.micro:12041 net.micro.68k:1135 net.micro.cbm:1728 net.micro.atari:1165 net.micro.amiga:188 net.news.group:3806
Summary: See net.micro.{atari,amiga,cbm} if you're interested

I recently discovered that there's a fair bit of discussion about the
new 68000 based home computers on the net. It's just not obvious to
many of us who long ago unsubscribed from net.micro.atari and net.micro.cbm,
not wanting to hear about the toy machines. This is a shame, especially
considering the lack of good media coverage of these machines.

Gnu's Guideline to where to read and post:

net.micro.68k is for 68k architecture related stuff only, and an
         occasional pointer to other info (like this one).
         Little or no Jacki/Amiga traffic should go here.

net.micro.atari   For both toy and Jackintosh Atari traffic -- currently
         mostly Jackintosh.

net.micro.amiga   For the Amiga only.

net.micro.cbm should be for non-Amiga Commodores only, but people
         are posting Amiga stuff there anyway. I recommend
         reading the newsgroup until people finger it out,
         but not posting anything there. ["cbm" stands for
         Commodore Business Machines.]

net.sources   For sources for any machine. Don't post (or cross-post)
         sources to any of the above groups. There is a
         net.sources.mac which is for posting Mac binaries -- a habit
         that I'd like to strongly discourage, now that we have
         a variety of Mac-like machines that don't run each others'
         binaries. Source, or nothing, please!

They're off! -- and may the best machine* win!   *or machines

Looks like they may be using OS-9's 'no mmu' trick of making all code
relocatable through the compiler. Looks like the only safe place is WCS.
(OS-9 has a protected MMU option).

> >There isn't one, so it doesn't do it safely, although the Amiga loyalists
> >are kind of blind about this point. I think that when you boot up a
> >   (harvard!talcott!panda!enmasse!mroddy)
> I have heard (from someone looking under the hood) that the Atari 520ST
> has a chip labelled "MMU". Is this an MMU? Is it any good? If so, this
                ^^^
> would seem to be a significant advantage for the ST.

An old Dvorak column indicated that Atari was working on at least TWO OS's,
the CP/M-68k, and a multi-tasking one. Since CP/M doesn't need MMU support,
there would be no documentation of it. If 'concurrent' was the other system
and just took too long, then considering the Insistance of DRI that the
AT provide priveledged memory protection and MMU, there would be even
stronger need (and capability) for it in the ST.

"Presenting the ATARI ST" has a memory map on page 34 that show address
$FF8000-$FF8200 labled "DATA CONFIGURATION", in the I/O region. If that
ain't an MMU term, what is? (Interesting 512 bytes - 512K hmmm), if they
send you a 68010 with your next OS, watch out!!!. Anybody look at those
addresses?

If this is the case, does that mean that the 512K in the machine is
really the CACHE for an external RAM disk?

I've been looking at what is available in SCSI devices lately, seems
IOMEGA makes a BOURNELLI BOX for it. Others items included an 80MB
disk drive ($1000 Q 5000, no enclosure), a couple of 8" drives, and
a few of the little drives. Isn't that also the usual MAC hard disk
interface?

What is SCSI (Small Computer Standard Interface)? Is it some sort of
super-fast GPIB? I noticed one of the functions was some sort of
"find pattern" command. What are some of the others? (If there are
a lot, a few examples would be nice).

I noticed that 1.33Mbytes/sec is about 10Mbit/sec, anybody know of an
Ethernet to SCSI interface?

Does AMIGA have an SCSI interface? (I saw one SCSI controller card for IBM).

Are HPIB and SCSI commands mutually exclusive? Are the busses similar?

While we are being technical:

'Presenting...' describes the BIOS vectors and the BDOS vectors, where is VDI? Is it a 'trap vector', a 'run-time library', or a 'link-time library'?

Are the TOS vectors any better than the BDOS vectors (Seek sequential, Flush, buffering...), are BIOS vectors still available?

Does VDI use the Graphics chip to do the painting, or does it 'bit bump' like the MAC?

What's the top speed on the 68901 (rs232 port)? Do the sync pins (RxC,TxC) go anywhere?

What are some of the GPU operations? How do they compare with the NEC 7220?

bf,
Of the word processors you mentioned, only one works 80 columns (with the addition of either the Bit-3, Austin-Franklin, or OMNIVIEW), namely Letter Perfect. Letter Perfect has the added advantage of being able to merge with the data base program Data Perfect, recognized as the most powerful (albeit complex to learn) data base for the ATARI 8 bitters. It has the disadvantage of being a memory hog; putting a single return at the beginning of a line takes up 80 bytes of text buffer!

I have also found the program SpeedScript, published by Compute in May, to be more popular than any of those that you mentioned except Letter Perfect and ATARIWRITER. Its main advantages are that it is very easy to use and uses ATARI DOS format for its file storage. (The biggest gripe about Letter Perfect is that it has its own DOS, incompatible with everything else.) I found it to be such a nifty program that I rewrote it to work 80 columns with OMNIVIEW and greatly enhanced its operation in the process. It is provided free of charge with every OMNIVIEW.

And how could you forget that old dog, the original Atari Word Processor? It is notable for its dozens of menus, proving just how user unfriendly a menu driven program can be, its support of only ATARI printers, and the original drop back mode (probably its only redeeming feature) for previewing the output using high resolution graphics to depict its structure.

There are others that have not been mentioned; Text Wizard and Wordman both come to mind. I even used the combination of MEDIT (the ATARI program text editor) and FORMS (output formatter) for a while, which, while powerful, was slow and cumbersome. I shudder to think what we had to put up with back in the old days to create decent documents!

I still feel that Byte's responsibility, as a member of the Press, is
to give us the information that is important to us. The ST is, I feel,
more important than a new IBM compatible. It should not matter what is
convenient for them. They should have tracked down an ST and wheedled
Tramiel into giving them info. I don't think they tried... I do blame
Byte if they are not flexible enough to go out of their way when the
situation warrants it.

[]
There are only 2 monitors I would recommend for the 8 bit ATARIs.
1) Commodore 1702 (new version of the same 1701)
or
2) AMDEK 300

These are the only monitors which accept chroma/luminance inputs that
will give the crisp image that the ATARIs are capable of.
The XL has dropped the Chroma output, but the composite video signal
can be substituted. The luminance signal is still available.

Both of these monitors are available for about $200.

>over hyped both in the press and on the net. For example none of
>magazines reviewing the amiga compare features and price with the ST
>but only with overpriced products like the mac and the ibm pc.

This is a very good point. The ST and Amiga are somewhat similar machines,
and actually there will probably be *some* overlap of their markets. When you
look at the prices of both systems *WITHOUT* the monitors, they are not all
that far apart. I don't really think that it is fair to call one simply a
BETTER machine. My C64 is better than my UNIX box, for playing games. But
for serious work... I think that the choice between the ST and Amiga would
depend on the needs and priorities of the individual, since they do have their
different capabilities.

I bought an Atari 800 two Christmases ago, when they dropped below $100.
I have since added 2 1050 disk drives, each received with single density
DOS. Both drives were "registered" with Atari, and have been under continuous
maintenance contracts, although never serviced.

I have seen several comments lately regarding the "double density" DOS.
Shouldn't I have received it, or at least a notice of how to get it, from
Atari? Is there some action I am supposed to take to ask for it?

> >> I hate to dampen the Amiga fire, but the Amiga is a doomed machine.
> >> How can I say this before 1 Amiga is sold? Simple, this is history
> >> repeating it self, all over again.
> Just as the C-64/Atari/Apple][have a different market than the IBM PC-AT,

The Apple II and C-64 market rarely overlapped, in either price or
capabilities. The II was a home/business machine (also a home-business
machine) and the C-64 was the best game machine at the best price.

> I hope that the Atari ST and the Amiga both
> do well. It is the MAC that will really suffer as a result of these two
> machines. As usual, Apple will be selling less machine for more money.

It's quite obvious that the market for home computers, let alone expensive
high-priced home computers, is finite. The Mac has made only a small
penetration into the general office market recently, primarily for
chart- and slide-making (one per groups, vs. one IBM PC per user).

The Atari will not have a business impact; the Amiga, because of its
distribution and the not-hidden-enough name ("Commodore") will have
a negligible impact, primarily in some graphics and video applications.
The 1986 open Mac will likely put any corporate Mac owners back off
the fence and into Apple's camp, should they be tempted now by Amiga.

I'm not saying the Amiga doesn't have better hardware (I've never
seen one. Have you?), but software, distribution, marketting, and
even market psychology are far more important to success.

So, getting back to the original question: which 2 computers will
survive in the home market? The Mac be one, because it
already has a foothold, software, and a fanatic group of owners.

The Amiga vs. ST? The last battle obviously went to the C64.
Which do you bet on, the company (Commodore) or its president
(Tramiel, now with Atari.) Both companies are in precarious
positions, so I suspect that this year's Christmas sales will
probably decide the war.

Does anyone have info for converting an Atari 400 16K memory board
to use 4164 chips? I might go as far as buying a bare board and
populating it, but i would prefer to kluge up the existing board
to use the 64K chips.
Thanks,
Den Smith

I am thinking of getting a second 31/2 inch floppy disk for my ST. There are a couple of questions I would like to ask first.

1. From within GEM, I tried installing more disk drives (by selecting the Install item from one of the menus). I found that disk C is reserved for the cartridge slot -- this I take is for the ROM disk. I tried installing more disks, but this is as far as I got. Now, I remember reading somewhere that the ST's hardware will handle up to 4 floppies, so does this mean that they have changed the total number to 2? Does this mean that the hard disk cannot be used with 2 floppies already installed? I would appreciate it if someone armed with the official documentation (I don't have any) or the like would tell me the score.

2. Has anybody succeeded in getting a 51/4 inch drive hooked up to their ST? I might consider that alternative too.

     MC68000P8 is Motorola's part number for an 8 MHz 68k in a plastic
package, not to be confused with a MC68008P8 which is a 68000 with an
8-bit external bus.

     I, too, would like to see more technical info on the ST. Can
someone out there oblige?

How about a "net.micro.windows" or a "net.micro.BitBlt", for machines with
crufty graphics user interfaces as their main selling point?

There are going to be more and more of them, and they do have a lot in common
(despite the fanatics flames)...

I just got a peek at the Atari ST developer's package, the one they send you for $300. It comes in an 8.5 by 11 by about 10 inch box, with 4000 pages of unbound documentation, and six floppies. The floppies include: GEM, TOS, Cpm-68k, 68000 assembler, linker, debugger, LOGO, and C compiler.

My understanding is that they will send you the stuff no questions asked, if you supply the serial number of your ST. Could it be that this computer has a hardware readable serial number? Also schematics are included!!

My impression after a cursory glance is that the documentation is fairly recent, and complete. As far as being easy to read, it's not at a tutorial level, but it's fairly well written. I would say it's a MUST for hackers. I was playing around with the CPM68k, SID, etc. and learned a lot just poking around in the system base page. There are a complete set of GEM listings in C, of course.

Atari also offers GEM courses, as 2 day seminars for mucho bucks. I would like to see longer seminars on a weekly basis. There is too much stuff to cram into 2 consecutive days.

Anyway, if you get this package, happy hacking!!!!

I took a peek at the schematics provided by the Atari ST developers' kit.
The MIDI interface is essentially a Motorola 6850 ACIA driven by a SHARP
900 opto-isolator. Output apperas to be standard open-collector logic.
Ther are actually TWO 6850's in the box. The second goes to an output port
directly. I don't know for what purpose.

As far as I/O addresses, the chip select comes from the "glue" chip, so it's
not obvious what they are. I couldn't find a refernce to the addresses in the
ducumentation either. Perhaps the developers package contains a more detailed
I/O memory map, but I haven't found it yet.

Sorry, I can only help with the 68000P8. That means that the 68000 processor
is the 8 Mhz version.

It is the same one that is in the Apple Macintosh.

    Okay, I'll bite. What the heck is an "open Mac" and why will it push
corporate Mac owners off the fence?

First, the keyboards are from the 1200XL and not the 800XL as I said.

Second, the TI keyboards once offered were gobbled up as soon as they hit the shelves. If you want an Atari keyboard I suggest polling the RS stores in your area by telephone ASAP.

The keyboard uses a membrane switching matrix actuated by mechanical keys. The major difference with the 400 keyboard is that the 1200XL KB includes the 2 MOS chips that encode the keystrokes. On the 400, the chips are on the motherboard. Interfacing requires removing the chips from the 1200 KB and bringing the proper connections out with a 22 wire cable which can plug into the KB socket on the 400. The Atari Technical Reference shows the mapping between the keyboard socket and encoding chip pins. Comparing foil patterns is a more difficult way of figuring things out.

Good Luck -
Jim

I've been hearing all sorts of comments with regards to the development package Atari has made available for the ST. Having just received my ST yesterday (with pretty RGB monitor :-) I'm wondering if it would be worth my while to procure this development package. What I'd like to know is where can the package be found (who's selling it), how much it will take me for (cost), and what all is in the package. I'm very interested in getting a C compiler sometime soon so I can do some serious playing around and this sounds like it may be the way to go.

Comments?

BTW - The ST is very pretty! It's not quite as pretty as a Sun, but then
it doesn't cost as much, either :-)

```

I have heard much lately about a development package for the ST's.
I am interested in knowing if this is a worthwhile investment. My ST
with bright and glowing RGB monitor arrived just yesterday and although

Logo is supposed to be fairly decent as a language, I am much more comfortable
using C. I hope to have a C compiler in hand someday soon, either one way
or another, and I believe that the development package has a decent C compiler.
What else is in the package? How much does it cost? Who do I contact to
procure such an item? The answers to these and other questions will
gratefully be accepted at your earliest convienience. Oh well, back to
real work.

gerrit

P.S. - the ST is very, very sharp - not as sharp as a Sun, but also not
       quite the same price.

After poking around some more in the Atari developer's literature, I found
out some more stuff about MIDI. Apparently, the I/O is at $fffffc06. This is
the address of the 6850 ACIA chip. They do have a handler set up to send and

receive MIDI data, that can be called from C or assembly code. One thing I found objectionable is the way they handle incoming MIDI stuff. Each byte is time-stamped with 3 bytes of time info. That means that a key-press would take 12 bytes of memory, and each note (key dn, key up) would require 24 bytes.
The time stamp is referenced to the 200 tick/sec system clock, not to any user-definable clock. All of this means you would have to ignore the input handler, and write your own.
Well, at least they wrote SOME software for the port.

I don't know about you but I'm not a little kid who needs hir hand held when se plays games. I'm not a beancounter who uses prepackaged applications in Lotus. I'm not a writer like Jerry Pournelle who needs the world's greatest

word processor.

I'm a programmer. Without us, there will never be any applications. We need
to be able to do 10 or 15 things at once so we can get software out before
the press calls it vaporware. We need multitasking.

UNIX is our application.

Does anyone know where to get a hold of 14 and 13 pin DIN plugs. I need both male and female. These connectors are used for the Atari 520ST disk drives and monitors. Thanks for the help.

The vt52 does not use standout mode, which is a bloody shame
if you use emacs (status line). Anyway, the seuqence ``esc p'' puts the
ST's terminal into inverse video (standout) mode, and ``esc q'' takes
it out. There are a lot more non-vt52 things, but I haven't finished
compiling them. I'll post as soon as that's done. Until then, the following
termcap was borrowed from our entry for vt52, and the last line added to
allow emacs to use standout mode for the status line(s).
The \EL sequence deletes a line and returns the cursor to the leftmost column.

This following entry is modified from the vt52's termcap, and allows
inverse video line

   Isn't there a version of the OS9 operating system available which will run on 68000-based machines? I believe I've heard or read that it is. From the small amount of expierience I've had with it, I think it may be very nice to have on the ST. If any other ST users are as frustrated with the current operating system as I am, then they too would want to have it for their ST's.
   OS9 supports full multi-tasking, has re-directable standard input and standard outputs (just like unix) as well as pipes. The only thing it is lacking in is a full set of utilities like sed, awk and others. Since OS9 was primarily designed for smaller machines without hard drives, they could not quite fit these in. Motorola developed the OS9 operating system but I don't know about the liscensing agreements (if any) that would have to be secured. The OS9 I used was on a 6809 based machine with 64K of memory and was very nice. The machine did slow down a bit when more than four or five processes were run concurrently, but I don't think that will be the case with

the ST since it has a 68000 and 512K of memory.
   If anyone out there has any information about how one might go about porting OS9 over to an ST or has already done so, I would be very interested in hearing about it.

>

Well I for one don't see how either of these assertions can be true.

1) Programs can't be arbitrarily large, they have to fit into what is left
of memory, a variable dependent on what happens to be loaded at the time.
This is not the same as a multiprocessing system that allows any combination
of processes to coexist, limiting only the number of concurrent processes.

2) They do have to be well behaved. This is far more serious a problem with
the base register relocation scheme used in the Amiga. There is no way to
prevent task_1 from writing all over task_2. Without the hardware protection
offered by an MMU, you are left with trust as the only protection between
~~~~~~

the address space of individual tasks. I must assume that the address faults mentioned above are writing off the end of known space type faults.

> I got this information from one of the people who designed the Amiga's
> multitasking operating system. All in all, I was very impressed
> by the number of things that they got right.

These people are not objective.

Hey, I can help! I just received my software development package from Atari, and it has just tons of documentation. I'll just look through this stuff for some neato hardware specs (like the ones that came with the 800 technical manuals.) Wait right there while I look for the specs.

I'll be just a few minutes.

I know there here someplace.

Uh, maybe I put them over there.

Jeez, I can't seem to find them.

Oh well, :-)

Have any of you out in netland worked with sam or any other speech synthesizer on the 800xl? I've been trying for awhile to no avail. Sam stays mum no matter what. I've followed the directions on creating the disk with 'mem sav' with no success. The 800 I have uses revision B of basic, and has the Boss installed to disable basic unless you swith a toggle to regular, or depress the option key (instead of vice-versa).

Help Please,

Matt Scholz

I used to know a contractor named Ken Barbier that used to live in Borrego Springs, CA. In the late 70's he moved to Socorro, New Mexico, but I can't find him there. He was one of the best hackers I ever knew, and a regular

contributor to Byte and Kilobaud magazines. Anybody know how I can reach him?

Does anyone have a solution for
getting the 800XL to generate
a tilde? I do not see it in the
ATASCII character set, but wondered
if anyone using an ATARI as a
terminal to a 4.2BSD system had
found a way around this.

Thanks

Sorry about posting this to the whole net but mail to you bounced.

Unless I'm mistaken the 1027 is their teeny drum printer, which uses
a mechanism resembling the insides of an adding machine. The drum
is inked with a fabric roller that snaps in and out of the clip it's
mounted on (I haven't got my printer in front of me). You pull the
roller out, re-ink it with stamp pad ink that you buy at your local
stationery store, and click it back into place. (My printer has
a different manufacturer's label and a standard interface instead
of Atari's, but I think it is the same mechanism).

Hope this helps.

*** REP   T I L E   SAGE ***

   I'm just starting to mess around with type-in Basic programs from magazines (Compute!, Antic) on my 1200XL, and I'm finding that most programs will not run without modification. I have two problems with this. Firstly, the #$%&! introductory basic book mentions the fact that one can get errors, but fails to give a table of error numbers and their meaning! Could some kind soul provide me with a pointer to some comprehensive Atari Basic documentation, and perhaps e-mail a list of error numbers and decriptions for me to use until such time as I can get it?
   Secondly, do other XL owners have the same kind of problems (or conversely, do non-XL owners NOT have these problems)? I have Compute!'s Master Memory Map book, which includes a section on differences between the 1200XL and "normal" machines, and will start checking the programs for use of inconsistent memory locations. Can anybody suggest any other approaches? I'm considering writing to the magazines to get suggestions, but thought I'd try here first.

   Please e-mail any responses to me; if there is sufficient interest I'll send/post a summary.

There seem to be a few people out there with developer's kits for
the atari 520ST. I would like to set up a mailing list so we can
exchange hints, suggestions, ideas on writing software on the ST.
If you are interested in being a part of this mailing list please

reply to me. To the others on net.micro.atari, I am not suggesting
that we bypass net.micro.atari but that details of this sort are
better suited for mailing lists. If anything of general interest
comes up I will of course relay it to net.micro.atari. Thanks.

Summary: Port for ST of OS68K

We have a port pack (running on our unix box) for OS9-68K and an ST.
A friend and I would be willing to port it if we can get the
hard core technical information. Unfortunatly right now fianances are
such that neither of us can lay out the money for the developers kit. So
if any generous soul in the area can help us out with a look at the
specs we will do the port.

If this is the one with the carbon spark that deposits on the paper,
then yes, it does work. My parents got one for their apple. Be sure
to get plenty of supplies (electrodes, etc.) for this discontinued item.

I have formed an ST developers mailing list. If you wish to
join the list mail to:

ARPA: info-st-request@eneevax.arpa
UUCP: {seismo,allegra}!umcp-cs!eneevax!info-st-request

To send mail to the list mail to:

ARPA: info-st@eneevax.arpa
UUCP: {seismo,allegra}!umcp-cs!eneevax!info-st

Info of general interest will be posted to net.micro.atari.

Here are a few graphics demos that I ported from the sun. They run fine
on my monochrome monitor, but I haven't tried it with a color monitor.
I would imagine that they will run but without any color. You need the
DR C development system or other c compiler with the gem bindings. No
fancy windowing but they show the graphics capability of the ST very
nicely.

: Run this shell script with "sh" not "csh"

```

I was recently able to purchase an Atari 1200 keyboard at the local Radio Shack
and would appreciate any hints from users out there who can tell me how to use
```

it for my Atari 400.

Thanks to the people who posted the news that the keyboards were available
at Radio Shack, and thanks in advance for the conversion info.

Looking at the Commordore stuff today, I noticed a sqeeze and unsqueeze
for it. I was wondering if anything out there in net land existed to
do this for the Atari 400/800 line? It would certainly help keep down
costs associated with calling bulletin boards!

I am trying to track down a colleague of mine from the 70's, Ken Barbier,
who used to work out of Borrego Sprgs., CA as a contractor. He then moved to

Socorro, N.M. and I lost track of him. He used to write for Byte magazine.
Does anyone know where he might be now? Thanks in advance,

Bill Sinclair

CompuClub (Atari mail order service) is selling the 520ST Monochrome
for $750 (In stock) and the 520ST Color for $900. They were not in
stock as of the last newsletter.

Unlimited Software, Inc also said that they would have club prices,
although they were not set as of their last mailing. Discounts are
available.

This seems to be asked by a lot of people, so I am posting it here for
general interest. There are two questions:

1) Is there a way to set up an application so that it is ALWAYS installed?
   When you install a program, where is that information saved?

What does it mean to install an application? What actually
goes on?

2) Is there a way to set up a disk, so that you can boot up to TOS (or CPM68k), rather than having to re-boot from GEM? A lot of us would rather work with command lines rather than the mouse, and don't want to keep swapping floppies in order to get back to GEM.

Paul,
   I have re-inked the ribbon several times. It has gotten so
damaged just from use that it needs to be replaced. Do you
know anywhere I can find it at??

I just received the latest (October) issue of ANTIC. I'll submit my
usual table of contents shortly but I wanted to share this information
with those interested in the 520ST discussion.

According to an article in the 520ST section, the Dragon Group has just
released a product called 4xFORTH. It's twice as fast as MacForth and
it's capable of multi-tasking and multi-user functions. ANTIC will
have a full review in the November issue. Looks like ST owners won't
have to feel like poor cousins to other 68000 based machines.

Well, I don't want to get involved in the Amiga-ST wars, but you'll be happy to know that, if true, then the ST has just caught up with the Timex-Sinclair 1000, at least as far as having a multi-tasking Forth is concerned. I doubt if there's a computer on the market that doesn't have one. (Boy, talk about asking for it. No doubt there is, and I'll soon hear about it, ad nauseum)

Lines: 26

During the month of July, ANTIC magazine subscribers can sign up for
a free lifetime subscription to DELPHI database plus one hour of free
time. DELPHI is similar to COMPUSERVE but there are a few advantages
if you have a 1200 bps modem. The connect time is the same for 1200
as it is for 300. It costs $6.00 per hour (off hours). They have
s group called ANTIC ONLINE and they will be putting the same information
there that they are currently putting on COMPUSERVE. They will be on
both services now. SIG*ATARI will also be on DELPHI.

DELPHI is undergoing great changes according to an article in ANTIC.
They offer news, email and searchable databases, but specialize in
user created files, which may be either public or private. The usual
lifetime subscription (including 2 hours) is $50, so you are getting
a pretty good deal.

If you are not an ANTIC subscriber, you can sign up for DELPHI and
subscribe to ANTIC at the same time on-line. See page 7 of the August
1985 issue of ANTIC. I don't know if it is on the news stands yet.

Happy Telecomputing...

Yesterday I called ATARI in Germany. They told me that the 520 ST will be
delayed. New scheduling date: End of July till start of August.

They will have a lot to do in the last view months, to get their million
computers sold. :-)

  With the advent of relatively cheap read-only storage (i.e the
CD ROM), wouldn't it now be practical to run UNIX on some of these
cheap-but-powerful personal computers that are coming down the pike?
  Supposedly a CD can hold about 550 megabytes, so it would be easy to
put the UNIX manual pages and system programs (kernel, ls, cat, yacc, etc.)
onto a CD (an audio CD now sells for about $15-$20, so bug-fixes and
upgrades shouldn't be expensive), then use a small hard-disk drive or
even one of the new fast mini-floppies for the rest of the system that
can't be put in ROM.
  Does anybody know if this is in the cards?

> even one of the new fast mini-floppies for the rest of the system that
> can't be put in ROM.
The main problem with the CD/ROM is that the worst case access time is
over 1 second. On second thought, perhaps its not such a problem people
used to a heavily loaded vax might see a performance improvement.

I am sure that someone, somewhere, is going to put some flavor of UNIX
on the new 68000 machines. Most of the people that are considering it
complain that the memory management on the ST/Amiga is too simple for
the kind of UNIX system they want.

A good alternative for the ST might be OS-9 (level 1) which as far as I
can tell has all the things I like about UNIX, and the Amiga is supposed
to come with a multi tasking OS (called Intuition) built in.

[.........]

Hello again gang,

WHEW! I've been receiving all kinds of responses to my query about
help in converting the Dr. Dobbs C64 solids program to Atari format
disks. While I may not be able to respond to all of your notes, I
thank you for your responses. I think I have figured out whos help
I would like to recruit, but I will probably wait for the smoke to
clear just in case.

Also, I did see some slight confusion, what I am trying to convert
is 6502 machine language SOURCE, and a teeny bit of Basic source.

For those of you who would like to get a copy in the original C64
form for yourselves, the best way is probably to do what I did, send
the author $5 a floppy disk and a self addressed mailer. I can't
easily make C64 copies, and from the note that came with the disk
I think the author would prefer that you contact him directly anyway.

Here is his address:

Richard Rylander
179 N. McKnight Rd. Apt 203

St. Paul, MN. 55119

I strongly recommend that you get a hold of the May 1985 Dr. Dobbs, as the accompanying article is indespensable to the full understanding of the packages operation. (you don't get much more than loading instructions with the floppy).

Again, thanks for the offers of help. If you don't hear from me directly (via mail) fairly soon, than you can figure that I've enlisted one of you'ses help and/or am making progress.

For the Atarians out there, assuming 1) I get the package converted, and 2) I get it up and running, I will consult with Mr. Rylander about how it can be made available to the Atari gang. I'll keep you posted.

August 1985 ANTIC Table of Contents
Theme: Telecommunications

Page Article

9 WORLDWIDE USERS NETWORK
An article on the activities of WUN and announcing that Chris Crawford would be teaching an 8 month course on Assembly Language on ANTIC ONLINE on CompuServe.
11 PROFILES: THE MICROBITS STORY
An article on Alan Ackerman and John Wiley, founders of MPP. Where they're at and where they're going.

12 STARTING OUT: COMMUNICATING COMPUTERS
A beginners guide to telecommunicating with your computer.
20 INTERIORS--OPENING UP THE 520ST
An inside look at the 520ST.
22 MEET GEM DESKTOP--GET STARTED OPERATING YOUR ST
A look at what GEM can do and how to use it.
24 ST SOFTWARE NEWS
What some suppliers have announced.
25 ST FILE TRANSFERS WITH KERMIT
How to "port" programs between Atari's.
28 ATARI 'TOONS
Create funny and inventive cartoons with remarkable ease by animating text. Save your creations and play them back at any speed.
31 ATARI 'TOONS CONTEST
Use the previous program and win a new MPP 1200 Baud Modem. Entries must be received by Oct. 1, 1985.
33 GAME OF THE MONTH: VALIANT
Valiant is a big, fast-scrolling maze adventure from the Author of "Arena Racer" (ANTIC, May, 1985). BASIC with ML subroutines.
36 UNLEASHING THE 1030 MODEM
How to access the powerful commands of the little-known device handler software built into the popular ATARI 1030 modem. Written by Russ Wetmore, it contains a lot of useful information and two BASIC programs to get you on line.
41 BULLETIN BOARD CONSTRUCTION SET
A review of a new Bulletin Board program that gives a sysop more power than ever before. It supports several levels of security and privileges. This program will be sold by ANTIC through their catalog. They list three bulletin boards that are running this program so you can call them if you want to see it in action.
43 PRO*TERM: SUPERB NEW MODEM PROGRAM
A terminal program for your ATARI 1030 that lets you upload and download files in capture and XMODEM protocol. It is packed with professional-level features including Sprint and MCI invisible-code autodialing and multi-disk-based directories. It is the second largest program ever to appear in ANTIC so you might want to buy the disk for this month. ($12.95 + $3.00 S & H)
45 LOW COST E-MAIL
A discussion of what electronic mail can do for you and a look at email provided by CompuServe, etc.
48 DISPLAY MASTER
Turn your picture files into silly putty by stretching, squeezing, folding, etc them with this program. It requires the ACTION! cartridge if you are going to type it out of the magazine. If you buy the disk, they include a run-time version that doesn't require the cartridge.

51 SOFTWARE LIBRARY
        The program listings for ATARI 'TOONS, PRO*TERM, DISPLAY
        MASTER, VALIANT and the two programs for Russ Wetmore's
        article on the built-in 1030 handlers.
72 PRODUCT REVIEWS
        SOFTWARE:
          SMART 1030 (E & B Computer Service)
          BALLBLAZER (EPYX Inc.)
          RESCUE ON FRACTALUS (EPYX Inc.)
          ADVENTURE MASTER (CBS Software)
          MAXWELL MANOR (Avalon Hill)

Comments: On their editorial page, ANTIC listed a few statistics to back
    up their claim to #1 ATARI computer magazine such as: a Yankee
    Group survey ranked ANTIC in 6th place among all computer mags,
    ANTIC was the only Atari specific magazine to make a list published
    by "Computer Publication Retailer" survey and ANTIC is among the
    top three sellers at B. Dalton. ANTIC printed a letter from
    Broderbund Software that stated they were releasing CHAMPIONSHIP
    LODE RUNNER in response to readers of ANTIC writing to them.
    ANTIC urged this action a couple of issues ago. ANTIC is starting
    a section of the magazine that is devoted to the ST line of
    computers. As you can see from the contents, they are all grouped
    together. A very good Issue, especially if you are into
    telecommunications.

Good news for all you early purchasers of the 520 ST's.
Duberman, the users' group liason confirmed that when
GEM becomes ROM-ified, we'll get the ROMs (maybe) free.

   A short note from the Bits & Bytes column by Evelyn Richards in the buisness section of the Wednsday, July 10th morning edition of the San Jose Mercury News.

   Atari delivered on Tuesday. The Atari user groups that had paid advances for the first Atari ST computers (dubbed Jackintosh) picked up their machines, as scheduled, on Tuesday. The San Leandro Computer Club, for one, took away 13 systems from the loading dock, for which it paid Atari close to $10,000.
   One essential piece was missing, however: the systems software diskettes. The user group expects to pick them up soon so that the Macintosh-like computers will be up and running.

The ATARI user groups are finally getting ST's as a member of one
of these groups rejoices on CompuServe:

Sb: The ST's are HERE!
Fm: Frank Nagle 70505,577
To: Jack P. Durre' 75046,476

Just thought I'd let you know that the ST's are out! As Tim said, we on
the West Coast just went over to Atari and picked them up! Wasn't quite
as easy as that! Had a little wait (2 hrs) and a little mixup, and then
finally the systems. As a matter of fact, the mixup continues, seems we
got machines without software! Will be going back tomorrow to get the
final pieces. I stopped by late tonight at Atari, caught Neil Harris
in, and got him to make a copy of TOS/GEM so I could type this in on
the VT52 emulator right now! Yes, I am using the ST, and it's a ***
FANTASTIC *** machine! Have the Monochrome monitor, and the resolution
is absolutely great. 80 columns and EXTREMELY READABLE. No more
eyestrain! As for shipments elsewhere in the country, have no definite
info from anyone at ATARI. Supposedly they were planning to ship either
yesterday (Monday the 8th) or today (Tuesday the 9th), but I can't
confirm that. Hope you get yours soon! Frank

From the latest (July 15th) issue of InfoWorld

Summary of a 2 page article on the Amiga, which includes an interview
with Thomas Rattigan, President of Commodore NA.

Stats:
- Based on 68000 and 3 custom chips
- To be announced on July 23rd
- At least 256k of memory expandable to 1 meg
- 880kbyte 3-1/2 inch format floppy
- Price $1500
- OS includes optional GEM-like graphics manager called Intuition

Add-on's mentioned:

- Color digitizer
- Video input
- Option that will run some IBM PC software.

Article is on pages 36 and 37.

The CD-ROM seeks fairly slow. Add in the fact that the UNIX file system
is not notably fast and CD-ROM have limited use as OS disks. However,
a staging of programs to a fast disk as they were used (sort of like
a UNIX Sticky bit) might be feasible. It would be a fun hack.

The New York Times has reported (7/9) that the 520ST is now shipping
in this country. This would seem to put paid to descriptions of the
system as vaporware. Now whether they can sell enough of them, in the
current market, is another question...

Whatever happened to the music-oriented machine (65XEM?) ???

Slow by comparison to a floppy? As long as we're only talking about
using it for ROM storage of commands and documentation, that shouldn't
be a problem. The transfer rate ought to be fine, it's just seek
that's slow. For those purposes it shouldn't matter much if it takes
a couple of seconds to position itself.

The staging idea is good, though, especially if you're using a fast
disk for paging: the CD-ROM could pre-load a whole image to the
fast disk and then page in pieces as needed (Z-magic).

[Spa Fon, Line Eater]

     I am desirous of using the (now inexpensive) Atari 800XL as a
     (now inexpensive) grafix display for my CP/M machine. It's a
     sin, tho', to ignore the game playing potential of the Atari,
     so...

     I would like to write a program under CP/M which watches the
     Atari serial bus and acts as a file server, storing a virtual

Atari disk under CP/M as a 90K file. A grafix program on the
Atari could read commands from a file with a grafix program on
my CP/M machine acting as a file. To do this I need to know
much about what the 800XL is saying on it's serial bus.

Anyone got any suggestions as to where I look?

may all your snarks be boojums,
to'c

I have been trying to set up the atari to do screen dumps with various
programs. So far no luck. I recently bought a koala pad thinking this
would be easier to dump. Still no luck. What is the best way to dump
this .pic file to the printer from a disk file.

Thanks in advance

Jack Fine

I'm not sure if they're still in operation, but there was a firm called
USS Enterprises :-) that marketed a package for doing just what you
describe. The package was called 'The Critical Connection' and required
you have a serial port on your CP/M box that could manage 19.2Kb.
They included a serial cable with a DB-25 on one end and an Atari
serial bus plug on the other, which would lead me to assume there
is some mapping between RS-232 and Ataribus. They allowed you to
simulate an Atari disk volume within CP/M, etc. Pournelle wrote it
up in one of his BYTE columns. Someone on the net have any further
information on this (continued existance, performance, etc.)?

I also seem to recall some Atari - CP/M program being posted to
CPMUG or SIG/M. If you have access to one of their catalogs,
they may also be of help.

Good luck.

Things have been kind of quiet in this group recently, which is odd
since if Atari's public statements were true the 520ST should be on
retailers shelves. Has any one seen one for sale? Someone claimed
that the 520ST was available in Canada, but there have been no recent
postings to tell us how wonderful the "Jackintosh" is when you buy
it and take it home.

What is happening to the user group machines? I saw one enthusiastic
posting about a VT52 (clearly state of the art) emulator. What else
can one do with the machines that have been shipped? Has the "mixup"
continued and the software somehow got lost?

Summary:

Well I finally got my 520ST development system. Boy is it nice. Very mac-like.
Files seem to load faster than the mac.

I recall reading an article by a member of a california user-group: could
you (or someone) post the RS-232C pinouts for the 520ST? My schematic is
smudged in that strategic position and besides, the draftsman seems to have
used a two-letter code that my RS-232 manual doesn't recognize...

As of today, (Friday July 19) the west coast distributer
(and therefore none of the stores) has not recieved any
Atari ST's - but they are in the mail.

(The distributer has talked to Atari, and is convinced that
they are working hard to get the machines out, but have to
fix a few minor things first.)

They were scheduled to be in the stores on July 15th.

I ordered one with a color monitor from The Bit Bucket in Newton, MA on
July 13. They offered a B-W version as a loaner on July 15, which is
when the got their first shipment. I declined, but if a dealer can
offer loaners, the supply must be copious.

All the software I saw was "in a state of development", i.e., menu options
were not implemented.

An article in the July 22nd issue of Electronic News quotes Atari
VP of sales and marketing, James Copland:

Atari is currently shipping 520 ST systems to distributers. Current
shipments are at 25,000 systems/week gearing up to 30,000 systems/week
in 3 to 4 weeks.

(On July 22nd, however, the west coast distributer has not recieved any
systems - and does not have a firm date from Atari as to when the
systems will arrive.)

I've connected the atari serial bus to my heathkit-100, mostly successfully.
I still get a moderate amount of checksum errors during data transfers, but
that's the fault of my not-yet-complete disk server program.

The atari serial bus is actually 19.2k baud, 8 bits, no parity. The only
problem is that it is running at TTL levels, and not RS-232. You can solve
this problem by attaching the cable between your computer's uart and it's
ttl-to-rs232 converter. You need to connect ground, send, receive, and one
more status line (it indicates the beginning of a command packet transfer).

If you want more specific information, just drop a line.

Does anyone own the Anchor Automation VolksModem 12 or the Signalman MK XII. I would like to know what they are like, how they are holding up, if you have had it a well, etc...

Also a while back someone asked about the R-verter, well what was the results, any good? Also are there any other RS232 interfaces besides that and the 850?

Thanks,
Jim.

Keywords: Atari 800XL

Hello,

I recently picked up an 800xl at a bargain price at a local catalog store. I have the advantage of a roommate with an 800 and some software, but perhaps you netters can help me.

I am mainly interested in graphics & sound hacking, Action!, Logo (for my child and me), and of course, communications. Don't mention BASIC - it makes me ill...

1) what book(s) are the best source of info on hardware specs, connector pinouts, and details on programming the smart chips of the machine?

2) how to get 80 columns (programming techinques)? Is this readable?

3) your favorite disk drive? Why hasn't anyone come out with a disk controller that interfaces to the parallel bus (or has someone)? This has got to be much faster than the current serial scheme...

4) your favorite (loosely called) DOS? My roomie seems to have a different flavor DOS for almost every disk he has!

5) favorite terminal emulator / file transfer program? I want to use this as a terminal to the Unix machines I have access to, and download from Atari bboard systems.

6) your favorite solution to the obnoxious compatibility problem(s) between the 800 and 800xl?

Thanks - I will attempt to collect and post a summary.

Mark Biggers

> What is happening to the user group machines? I saw one enthusiastic
> posting about a VT52 (clearly state of the art) emulator. What else
> can one do with the machines that have been shipped? Has the "mixup"
> continued and the software somehow got lost?
> Stephen J. Langdon   ...!{ihnp4,hplabs,sun,nsc}!amdahl!sjl

Judging from the traffic on CompuServes ATARISIG, most of the machines for
the users groups have arrived. There have been a few minor problems with
the machines, but all-in-all it seems that the people with ST's love them.

The July 22 issue of (I think) Electronic News quotes the Atari VP of
marketing and sales - they say they are shipping 20,000 a week and expect
to ramp up to 30-35,000 in a month or so. However, the west coast distributer
has not yet recieved any. "Your ST is in the mail".

The Official anouncement of the Commodore Amiga is due to happen this week,
and rumor has it that Commodore already has stock on hand ready to ship.

- Steve McIntosh, Kontron Electronics, Irvine CA.

For those of you (on the west coast in particular) who have purchased
the 520ST I was wondering about a couple of things. Does the 520ST come
with any software? Are you getting a color screen with your purchases?
What are you paying for the machine? What kinds of options are available
and at what price? (I mean add-on options i.e. harddisk?) Does it have
full 80-column editing and can it also handle 40-column? What is the
documentation like, lengthy, technical, simple-minded etc.?

I am obviously real interested in buying a 520ST especially since the
announcement of the CD-ROM. But before I do I want to know more about it.

Thank you for the information.
Jack Fine

   I'm looking for information as to what different methods there are
to duplicate copy-protected disks. Now before you start screaming
`COPYRIGHT' and `Yo-ho-ho' I'll mention that my copy of `Ball Blazer'
(which I bought) failed to boot last night and now I have to go through

the hassle of getting it replaced from Epyx. If they're prompt it may only take a week or so, if they're like most companies I expect it to take 3 to 4 weeks.
   Apart from the fact I don't know if I can live without `Ball Blazer' for a month why should I have too? I have never felt easy not having back-ups for my copy-protected programs and have decided to look into the ways available. I don't really care if the system simply duplicates the disk or compresses it into a binary load file, what I'm looking for is reliability and the capability to handle most copy-protection schemes.
   If anyone has any info on the different systems available, like the Happy drive or The Chip, I'd be interested in hearing from you.

Kevin Thompson   {ucbvax,ihnp4!nsc}!voder!kevin

*** Is there really a line-eater? ***

   Please forgive my asking what has most probably already been dealt with here mega-times, but...

   Can anybody provide me with the name, source, cost, and any relevant info on 'C' or other relatively high-level language compilers for the Atari? When I inquired at my local Atari store (which, alas, is now 1250 miles from my current home), the guy raved about Action!. Does anybody have any comments on this package?   I would really like something with utilities such as a linker, a library, and debugger (symbolic would be great). Thanks in advance for any information.

The Atari 520 reached Gemini Electronics near Morristown , N. J. last
week. The dealer, who is an Atari enthusiast, sent them all back---defective--
He expects another shipment this week. I got the impression the factory
confirmed some bad ones got out. I hope this was an isolated incident.

Well, we got our stock 520 ST today... Very nice, but the BASIC won't be out
for a while yet, and the GEM won't be available on ROM until the bugs are out.

In reply to the RS232 question someone posted, it looks like a standard
RS232...(isn't that what a standard is?), but I guess you wanted a list of
the active pins...I'll post when I get the chance later.

Latest word on the GEM in ROM is that it will be a $50 upgrade for early
models, but will be included in later ones (around Oct.)

Haba Software has a C compiler in Beta-test, and a 10Meg hard drive that
is FAST (about 7 times the speed of the already fast micro-floppy).

The color version is excellent, and a special cable is used for the
monitor connection so the 520 knows which monitor is hooked up. This
info is used to control the display! Output destined for the hi-res
monochrome monitor can't be viewed on the color monitor and vice-versa.

[re anyone seen an st?]
Yeah I have one at home.

[What came with it?]
Essentially nothing. What you get is the hardware package (computer,
monitor, ssdd 3.5 driver,) and GEM/TOS, and LOGO (or is it NO GO :-})

Gem seems to have a few bugs, i.e. it is possible to confuse it as
to which windows are where.

TOS is okay so far (the machine has been running for three days-
one crash so far.)

The printer interface is not configurable from the desktop.

The real time clock isn't battery backed up, and the start-up doesn't
require you to set it. (Bummer if you have a hard disk and want to
do incremental backups.)

The documentation is worse than horrible. The TOS guide is totally
superficial, and the LOGO manual is actually the worst users manual
I have ever seen.

A lot of retailers have returned units as DOA. But it appears that there
were two production QA flaws: loose chips and too long pins on some of
the pc boards (shorting onto the case or something.)

There is absolutely no mention of Basic or ROMTOS upgrades- although
Canadian buyers insist that they received coupons for Basic, and Atari
has claimed that TOS proms will be available (free?) to package purchasers.

The VT52 emulator is somewhat flakey about cursor addressing, and has
absolutely zero file transfer capability.

There is no software available for developers except through Atari,
and the procedure for obtaining development software from Atari is

less than straight-forward.

But all of this aside, the damn thing is cute! It clearly outperforms the MAC, and the desktop is an excellent environment. (Word of warning, this machine is better suited as a workstation than the ultimate game machine. If you want stereo 3D graphic animation, buy an Amiga when it materializes.)

Best advice: if you want to do development for the ST, go get one now and badger atari for the development software, if you want to use the thing, wait till september.

Happy HACKING.

So, now that everyone has them, could someone tell me what is
"standard" on the 520ST and when is the "mini"ST (250ST?)
coming out. Also, what are the prices for these respective systems?
Thanks,
Bob Switzer

I just read the article in the August 1985 issue of Personal Computing on the Commodore Amiga. There is little detail about the guts of the machine and the hardware.

All I've seen about the Atari 520ST has been in the net.micro.atari newsgroup. A little bit more about the hardware and the guts, but not much.

As you might expect, I'm in the market for one of these two machines, but have very little to go on. I know that I don't really want a Mac, both because of the price and the closed architecture. (I don't want to start any Mac vs. anything else flames, please!). The article on the Amiga says that it has "true multitasking", what ever that is.

Has anyone on the net made any point by point comparisons of these two machines? Apparently the 520ST isn't vaporware anymore, and hopefully the Amiga will begin to appear on dealer's shelves soon. I'm interested in what the nuts and bolts of the hardware are, and what the provided software and operating system do for/to you.

We were told that not all ST's were defective at Gemini, however an
apparent recurring problem is the disk drive controller in the ST.
Symptoms are either inability to read disks altogether, or inability to
format disks.
Some of these problems are rectified by opening the ST (beware...a soldering
iron is required to access the board, as the RF shield is soldered shut)
and pulling and reseating the socketed IC's. (only works sometimes...others
have BAD controller chips).
This problem initially looks like a drive problem, but since the floppy
controller is in the CPU, it's actually an ST problem.
Since ATARI does not have sufficient quantities available for an exchange
policy yet, and is strictly repairing units on a when-we-get-around-to-it
basis,....
I WOULD STRONGLY ADVISE TO TRY THE MACHINE OUT IN THE STORE BEFORE TAKING
IT HOME!!!!
Most stores will not have sufficient stock to replace defects for at least
another month, maybe longer!!!

Rob

Digital Devices makes a new interface for modems called the

U-CALL RS232. I don't know anything about it, but Lyco Computer
has it advertized for $37 in their latest ad (Analog Computing, Sept. 85).

Keywords: 800XL, 1525 Printer, VIC Modem, Atari modem
Xref: watmath net.micro.atari:956 net.micro.cbm:1556

I am thinking about buying an Atari 800XT (with disk drive) and would
like to be able to use my Commodore 1525 Printer and my VICModem with them to
save money. Does anyone know if this is possible/advisable/done_already?
How hard a conversion would it be (I don't know much about electronics
except for the basics of soldering and putting chips in sockets :-))?
If difficult, would I be likely to find a shop that could do these conversions
for me at a reasonable price?

In case it isn't possible, can anyone recommend a good modem (not too
expensive; I have the bottom-of-the-line VICModem and find it acceptible)
and terminal program?

Thanks.

If you want to be an ATARI ST developer, buy a development system directly
from ATARI. I got mine for the cost of the system plus $300 for the
development package (C compiler, linker, assembler, resource editor, kermit
(for file transfer), lots of documentation.)

I don't know why you say say that getting development software is less than
straight-forward... All I had to do was send a check.

>The VT52 emulator is somewhat flakey about cursor addressing, and has
>absolutely zero file transfer capability.

I use kermit for file transfer (it's more reliable than standard file
transfer anyway....)

Summary:

despite the fact that the 520ST was announced and shipped to dealers
first in canada, no one, to my knowledge, has actually managed to pick
up the ones that they have ordered. informed rumour has it that the
canadian division of the company was told to divert all it's orders to
the US to meet the demand. the earliest customer shipment in Kitchener
is supposedly August 18. we don't get no respect up here.

Apparently the chip reseating in the 520 is a cure for lots of troubles.
A friend of mine has a 520 that used to lock up occasionally. At times
it wouldn't boot. After reseating the chips all was fine. He mentioned
that it is quite simple to unsolder the RF shield that covers the main
circuit board. Only a few small blobs of solder to melt away.

        Wouldn't you know it. The instant the post about a good place for
Atari parts passes by, I end up needing a chip. Can whoever listed the
address of the store in California that stocked Atari parts please send or
post that address again?

        Also, I posted a request for information on directly controlling a
MPP modem a while back and got no replies. Is it really true that NOBODY has
any information on how to control that modem? I am not the only one who
wants to know, so if you do have any information or pointers please tell me
about them. I forward any replies to those who requested information from me.

                                        Daryll

I finally saw a 520ST in a local store the other day. It was running some pretty impressive demos, such as hi-res b&w pictures of the ST, Jack Tramiel and family, pictures of cowboys and a multiple bouncing ball. The quality of the b&w monitor is excellent, the picture is really crisp. Looking at the disk, it seems as though the capacity of the floppy is about 360K formatted, with TOS/GEM taking up about 206K currently (looks like they have a bit of paring down to get it into the 192K ROM). GEM looks much, much better on the ST than it does on the IBM PC. The keyboard feels good and the keys are well placed.

One thing I find annoying about the ST is that menus pop down when you move the cursor onto the menu bar, instead of only when you click the mouse on the menu bar, as in the mac. I found I often popped down menus by mistake and then had to click on the desktop to get rid of them. I guess I can live with it, though.

One of the desk accessories is a VT52 emulator (it looked fairly primitive... no windows, no menus). Other desk accessories were a control panel, clock calculator, but no breakout game.

They also had DR Logo for it. It looked reasonably complete, multiple windows, support for mouse, graphics, etc. good use of the menus. It also appears that GEM allows the use of control key equivalents for menu selections, as on the mac (I hate having to use the mouse exclusively, especially for text-editing).

The store said that they have already taken 100 orders for the machine, with

availability in about 2-3 weeks. The cost: $1400 Cdn (includes floppy, bw monitor, logo and basic).

Another store that had one was quite frustrated by the fact that the demo units came with no documentation. They had no idea how to use GEM and thus could not demo the ST at all. After showing them a few things, like double clicking and how to select items from the menus, they caught on. I guess this shows that mac-like interfaces are good because they are consistent, rather than because they are completely intuitive.

It looks like the ST might do quite well. Maybe Apple will finally have to reduce its inflated prices.

I would still like to hear more about Commodore's Amiga before I buy an ST. I thought they might introduce it (finally) at CES, but I guess I'll have to wait awhile. Looks like they don't mind giving Atari a head start.

David Rowley.

Tuesday, June 4, 1985

by Michael Ciraolo

Chicago, IL -- As companies debut new products for the Christmas buying season, there is enthusiastic interest in developing for both the new and old Atari computers. First the new:

The complete line of Infocom text adventure games will be available with the 16-bit Ataris.

Batteries Included announced a major commitment to the ST machines with their "IS" integrated software based on the GEM environment. According to Michael Reichmann, the company's director of product development, the entire line will work at an intuitive level, so that users will not have to memorize any commands.

According to the early announcement, the IS line will include a word processor with a built-in spelling checker, a combined spreadsheet and graphics package, a database manager, and a stock portfolio manager. The screen structure and layout are the same for all programs.

All programs in the IS series

will be released for the Atari STs and the IBM PC and compatible market. The first program, "Portfolio", will be available for the STs shortly after September 1, according to Batteries Included.

The Software Publisher Sierra On-Line will market the submarine simulation game GATO for the STs. GATO puts puts the player in the role of a World War II submarine commander, searching out and attempting to destroy the Japanese Imperial Fleet.

Sierra president Ken Williams said "We want to see exactly how large these two new markets are. We figure the best way to test the unknown waters is to publish a proven product (already out on the IBM, Macintosh and Apple 128K) with a broad appeal for maximum market penetration."

The flight simulator producers SubLogic said they would produce a simulator called Jet, and Electronic Arts is expected to release a financial cookbook, both products for the STs.

FTL Software, producers of the Apple II game Sundog, Frozen Legacy, are converting the game over to the Atari STs. The game won Family Computing's award for hybrid games last year--it is a role-playing economic simulation space adventure.

Many of these products were simply announced, with no date or price specified.

Several products for the 8-bit line of computers, including

the 130 XE, were also
announced.

Batteries Included, producers
of PaperClip, announced an
80-column display, the "BI-80",
for Atari 400/800, XL and XE
computers.

The BI-80 plugs into the Atari
cartridge slot and requires
extremely little special
programming or software
switching to use.

The cartridge is expected to cost
about $80.
~Developers said the BI-80
produces a clean, crisp display
ideal for writing
professional-quality documents.
Paperclip will be the first
software package released for
the Atari BI-80. There was a
functioning version of
80-column Atari Paperclip shown
at their booth.

According to John Skruch,
product manager for the XE
line, demand for the new 8-bit
computers is so high he can't
keep machines on warehouse
shelves for over 18 hours.

The new XE products Skruch
mentioned include programs from
First Star Software, Synapse
Software, and Adventure
International.

Atari is also getting ready to
release AtariWriter Plus,
currently in final testing, a
home productivity package
called Silent Butler, and a
proofreading program.

Skruch said this fall will also
see the release of a
planetarium program for the XEs
that includes over 17000
plotted stars. The program

will let users move through
time, choose viewing angles,
see constellations, track
Halley's comet, and so on.

The programs sought by Atari
Corp. continue to be
application and education
software, not games. "Atari
Incorporated was a video game
company that happened to make
computers. We're a computer
company that happens to make
video games," Skruch said.
"There aren't enough
applications for the Atari."

Skruch also said his company
has not released any 65XEs yet,
as the nearly identical 800XLs
are still available. When the
last 800XLs are sold, Atari
will start producing the 65XE.

"But at the price, the 130XE is
still the machine of choice,"
Skruch said.

Tuesday, June 4, 1985

by Michael Ciraolo

Chicago, IL--While many companies are instroducing one product apiece for the Atari STs, one company has announced an entire line of ST products.

Haba Systems, headquartered in Van Nuys, Calif., will release a word processor (HabaWord), a file and report manager (HabaFiles) and a spreadsheet and graphics package (HabaCalc N Graph) in September for $59.95 each, according to Charles Becker, vice president for sales.

A communications program, not surprisingly called HabaCom, will be released in August for the same price, Becker said.

The company, which produced the integrated spreadsheet, word processorand database /// Easy Pieces for the Apple ///, will also release Hippo C and a checkminder program in late July or early August.

Becker added that all of the Haba applications will feature pull-down menus and point-and-click editing.

Haba, which has written over 10 products for the Macintosh,

will port all of its current and future programs from the Mac to the Jackintosh, starting in January 1985, said Becker.

In addition to its line of software, Haba told ANTIC they will sell a 10 megabyte hard disk for $499 and a fully Hayes-compatible modem for $299. These products are called HabaDisk and HabaModem.

For people who are less than comfortable or fluent with computers, Haba offers Haba Software Solutions. Each retailing for $49.95, titles include How to Prepare and Manage a Home Budget, how to Write a Resume, How to Start Your Own Business, Business Forms, How to Prepare for the S.A.T., and so on.

The 46-member company is named for founder and chief executive officer Chaz Haba, who was director of marketing for Fairchild Semiconductor and who has started several small computer companies.

Becker said the Atari STs' combination of 68000 processor technology, GEM operating system, mouse, serial and parallel ports, 40 and 80 column mode and game (cartridge) port make the ST a "true industry leader," especially in light of Jack Tramiel's "genius for launching exciting, innovative and well-conceived products."

****

ANTIC EDITORIAL NOTE:

Antic's CES coverage will be completed Monday, June 10th. We're going to

wrap up the events of the past
week and shed more light
on the Atari presence at the
1985 Summer Consumer
Electronics Show. Expect two
more reports (ANTIC6.CES and
ANTIC7.CES).

I just purchased an 800XL due do the sudden price drop.

I previously had an 800, and have a lot of games on tape.
On the 800 to boot of off the tape, you turned on the computer while
holding down the START key. I can't seem to find out in the manual
how to do this on the XL. Doing it the old way still comes up with the
built-in BASIC.

Thanx,

Brian Walden

I'm having problems doing a library save (ctrl-Z) while inthe FS2
edit mode.
The disk "sounds" like it is formatting the normal way, but when the
write starts, horrible noises come from the TV and the disk read/write
error message appears. Here is everything I know:

1. I have a 130XE and Percom AT88 disk drives (2) with the "doubler"
    installed.

2. The blank disk I am saving to is not write protected.

3. I've tried several disks.

4. I've booted with and without the option key held down.

5. The system has not exhibited disk access problems with any
    other software.

If you've have good/bad experences with ctrl-z regardless of your system
configuration, please send me mail.

actually, you must hold down the option key(to disable basic)and the
start key(for cassette boot)at the same time. this should work, but if
it doesn't then it doesn't. was that a disclaimer or what?

Can someone please explain how Atari can reasonably expect
to sell a computer with 256K and no disk drive? And for
only $100 less than the same computer with a built in
disk drive? Are they serious?

Want to become rich? Sell cassette based software for the
ST260! Just kidding.

I haven't tried this, but you might try pressing both START and OPTION when
turning on the Atari. START by itself causes the Atari to beep (for a tape
load) but probably returns to BASIC afterwards. OPTION by itself causes the
Atari to lock out BASIC in favor of 8K more of usable RAM. The combination
might have the same effects as pressing START on an original Atari 800.

I can't get ANY of the terminal emulation modes to work with U*IX. Strangely,
VT52 works fine on VMS. Even something as simple as the "clear" command
refuses to work. Has anyone else suffered similar problems? Any solutions?

An item in the announcements column of the June Mini-Micro Systems
talks about two low-cost 3 1/2 inch winchesters being worked up by
Tandon. The 20Mb will go for $300 in OEM lots; the 10Mb, which is
specifically mentioned as 'planned for use by Atari in the ST series',
will 'sell for less than $100 in large OEM quantities'.

Access time given for the drives is 85 ms, comparable to the PC-XT
(and for that matter, the AT&T 7300). If the above holds true,
Tramiel's 'boasts' on low-cost hard disks don't seem nearly so
wild.

In Germany this book is published by Data Becker Software (a subsidary
of Auto Becker, a firm, which imports fine American cars to Germany).
It is call "Das Atari ST Premierenbuch".

My opinion about the book: same as the one of Art Willis.

At the Hannover Fair I got a fine hand out from Digital Research
about GEM. In this where on 3 pages much more information
than in the above book on 50 pages.

In the July 85 Analog Computing, the article 'Atari at Comdex' had
the following interesting paragraph re: the proposed 32-bit system:

> Atari officials stated that the 32-bit machine might run
> UNIX, with a secondary operating system available. The
> 32-bit machine will be sold only throgh computer stores.

Sounds promising to me. The original information was talking about
a price tag under $3000. Hope they can come through.

[This line for the old byte eater! xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx]

The reason for the implementation of the pop down menus (not "pull down")
in GEM is, as I have heard, that Apple has a patent on the specific
implementation of this type of menu.

>It looks like the ST might do quite well. Maybe Apple will finally have to
>reduce its inflated prices.

I hope too, that Apple "pulls down" the prices. I was an Apple fan for
years, but since they dropped the support for the II's, I have no
good wishes for Apple in the future. I think the rumors that Apple is
about to sold, shows that they have not the Rolls Royce image, Mr. Jobs
and Mr. Scully think they have. To be a good computer firm needs much
more than building only one good computer. Apple has to learn many
lessons until they are such a fantastic company like for instance HP.
This company takes also very high prices, but their service is ten
times better than the one of Apple. [The opinion expressed here is
my own one. Apple and any word combination of the word Apple, I think,
is a trademark of Apple Inc.]

> I can't get ANY of the terminal emulation modes to work with U*IX. Strangely

The new Chamelon available from Antic has a VT52xl terminal emulator and the
corresponding TERMCAP entry in the supplied documentation. If you want I
will send you the TERMCAP entry but I don't know if it will work with the
old Chamelon.

I'm thinking about buying an R-VERTER modem interface for the Atari.
Before I do, I wanted to know:
1. Has the 80 column software they've advertised become available?
2. Will it work at 1200 baud?
3. What kind of limitations does it have over, say, the 850 box?
4. What kind of terminal emulation software does it come with?

If you've got some info about this, I'd appreciate hearing from you!

Also, has anyone written Flight Simulator II mode libraries (ctrl-Z)
to Percom AT88 disk drives? I've tried it with an 800 (old) and a 130XE
but only get disk write errors. Is this a Percom compatability problem?

The cursor control sequences appear to be decoded before the incoming parity
is stripped. If your tty driver lets you send eight bit chars, you
can use Chameleon. I found that setting and then clearing litout on our 4.2 vax
seems to switch to into no parity mode. (I know. Its a bug, not a feature.)
Does anyone out there have 8 bit mode mods for 4.2?

I have an 800 and a new 800XL. I also have Action! and an Indus drive on
the 800.

I tried putting them on the XL and came up with the following
observations:

     1) With *ONLY* the Action! cart. (No disk)
      The XL boots to Action! fine.
     2) With Action! + Indus with a SINGLE density disk
      with OSS DOS XL (Original version (2.2?)):
      - starts to read disk then it "locks up" (blank
      - screen, disk stops)
      - push RESET and disk starts and BASIC comes up
      - (even with Action! in machine!)

     3) With Action! + Indus with SINGLE density + holding
      down the OPTION key:
      - boots Action!

- can write to disk, but cannot read (CTRL-SHFT-R)
- any programs, but can get a directory (?1:*.*)
- Try to read a program off the disk "locks up"
- the system, the only way out is RESET which tries
- to boot the disk but fails as in 2)

4) With Action! + Indus with DOUBLE density DOS XL:
- tries to boot but fails, system is "locked up"
- push RESET, but locks up again after trying to boot

5) With Action! + Indus with DOUBLE density DOS XL +
pushing the OPTION key:
- System boots Action!, acts just like 3) but
- on RESET it locks up like 4)

6) With Action! + Indus with ATARI DOS 2.0 (format "C"):
- boots Action!, works perfectly.
- can Read/Write, can use RESET normally.
NOTE: the OPTION key does not have to be pushed
to disable the BASIC like the others above.

7) Using the 800 operating system (XLFIX)
(see Analog, July 85):
- then booting SINGLE or DOUBLE DOS XL with
- Action! boots off drive but goes into BASIC.

8) Using XLFIX + pushing OPTION key:
- booting SINGLE or DOUBLE density boots Action!
- works perfectly.

9) Without Action! ALL DOS's boot fine with or
without BASIC.

I don't know why the three don't work together, but do work seperately. Has anyone else experienced these same problems?? Can anyone give me some insight in to what may be wrong, the 800XL, the Action! cartridge, or the Indus drive.

Thanx in advance.

Brian Walden

....!ihnp4!whuts!bsw

Action!,Indus,OSS,ATARI, and Analog are probably TradeMarks and therefore all are ACK'ed

Is there a decent Basic Tutorial program on disk for the 800 XL series
out there? Does anyone know a mail order house where I can get one?

Thanks in advance.

I noticed today a listing for IBM PC bulletin boards around the country.
Does anyone out there have a similar list for Atari Bulletin Boards?
If not, I would gladly compile such a list if people would send me
any information they have and I will post it to this newsgroup.

Thanks again.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
     Here is a list of the bulletin boards that are known to
be decated for the Atari Home Computer. If you have any additions
or deletions, PLEASE send me mail and I will update the list. The
list is currently in 40-column mode, very soon I will arrange it to
look like the list that Bill Blue uses.

Summary: VT-52 mode works with one change!

I encountered the same problem with the VT-52 emulation mode of Chameleon.
As I recall, the solution (obtained by trial and error) is to set the second
parity field in the menu to ODD (the default for both parities is NONE).

I have used my Atari 800 to dial-in to our VAX 750 a dozen times, and the
Chameleon package works perfectly, even with tricky editors like Jove!

David Comstock Tymnet, Inc.

CES WRAP-UP & COMMENTARY

MEANING OF NEW ST CHANGES

By MIKE CIRAOLO, JACK POWELL

6/10- At the June Consumer Electronics Show Atari announced that two new ST models and a pioneering 500 megabyte ROM compact disk system would appear on dealer shelves in time for the Christmas rush.

Complete lines of integrated software for the ST were announced by three major developers. First programs from the new productivity series were to ship this fall from Haba, Batteries Included and Rising Star. Haba also promised ST owners a 10 megabyte hard disk for $499 and a $299 Hayes-compatible modem.

NEW ST MODELS

Atari said that both new ST's will have 256K RAM of programmable memory. The 260ST will retail at $399. The 260STD is to be $499 and includes a built-in 3.5" disk drive. Otherwise they are identical with the 520ST except for the following:

* GEM and the rest of the TOS operating software will be on ROM chips instead of on disk.

* The television RF modulator is to be built-in.

* The new 256K models

won't ship till October or November.

520ST DEVELOPMENTS

How is all this significantly different from the 520ST?

According to Atari Marketing VP James Copland, the first 2,000 U.S. units of the 520ST were already shipping in June to Atari users groups.

In July the 520ST would appear in computer specialty stores, and mass merchandiser distribution of the ST line would begin in the fall, Copland stated.

By June, the 520ST was already on computer store shelves in Canada and parts of Western Europe.

Price of the 520ST was set at $799 and included a 3.5" disk drive, a high-resolution monochrome monitor, external RF modulator pack -- and GEM on disk, leaving 256K RAM in memory after loading GEM and TOS.

So all the 1985 ST's will now have no more than 256K of usable RAM...or will they?

ROM OR NOT?

For pre-Xmas delivery, manufacturing must begin no later than September. The CES announcement of the 260ST and 260STD gave Atari all of June and July to make sure GEM and TOS were thoroughly debugged.

These newly announced 260 models will allow Atari to

maintain credibility by meeting its pledge to ship the 520ST to US stores in early July. Disk updates could easily remedy any bugs found in the operating system of early 520ST's manufactured in May and June.

To Antic, the whole thing looks like a gutsy, clever move from Atari Chairman Jack Tramiel. Much of the U.S. business press unfortunately is computer-illiterate and reports even minor production delays as putting a company's entire future in doubt.Atari needed to bring an ST to market quickly as possible, even if in limited numbers.

Yet Tramiel had clearly learned a valuable lesson during his Commodore days, the glitchy Commodore 64 operating system that went into ROM sooner than it should. In the long run, rushing GEM and the ST operating sytem into chips before it was truly ready would create user problems and be bad business.

As this issue went to press, Atari had been issuing mixed signals about whether a 520ST GEM and operating system upgrade to ROM would be provided by the manufacturer.

Before and during CES, the company repeatedly said that the 520ST model would never have GEM and TOS in ROM. However, a June 7 message on CompuServe's SIG*Atari from a company spokesman quoted Atari president Sam Tramiel as saying the entire 520ST operating software would be

made available on simple plug-in chips at "nominal cost."

Of course, commercial 520ST software that doesn't use the GEM desktop can still draw on close to 400K of available RAM.

CD ROM

The mind-boggling 500 megabyte CD ROM was the hottest thing at CES. It was displayed at the Atari booth by Activenture,which is developing the technology under contract with Atari.

Imagine a read-only disk that's identical to a compact audio digital disk, but which could contain 100 volumes of reference books with room left over. And the 100 volumes of information would be instantly accessible. Only three seconds were required for the 520ST and CD ROM to search a keyword through an entire 26-volume encyclopedia.

And CD ROM could handle virtually any type of data that can be digitally encoded -- video images, software, photographs, etc.

The following interview with Jack Tramiel appeared this weekend on Compuserve. It was done by Jeffrey Williams of the Chicagoland Atari Users Group. Many thanks to them for making it publically available.

JACK TRAMIEL INTERVIEW
By Jeffrey J. Williams

Atari asked the Chicagoland Atari User Group (CL.A.U.G.) to help assist them with their exhibit at the Summer Consumer Electronics Show in Chicago. As one of the volunteers participating in the show, I asked Jack Tramiel for an interview that would appear in the newsletters of the various user groups I belong to (as well as any other groups that pick it up and choose to print it). He was most eager to talk to Atari users so he made time in a very busy day to talk with me. During the interview, I was somewhat nervous and sometimes had trouble following my notes, but Jack was very cordial and tried hard to put me at ease. We talked about CES, the ST series, the CD (compact disk) ROM device shown at CES, and Atari's relationship with user groups.

JJW: Atari announced that they would not be attending Summer CES. What prompted you to change your mind?

Tramiel: The CES show, the way we had to display it was too expensive to bring our booth, to refurbish the booth. It would have cost about $500,000 and I felt it wasn't worth it to spend that kind of money, that I could attract the people to come to a suite in Chicago during that time and to pay much less. When we were offered the present space, we took it because it cost much less. It was

strictly economics. We are here to produce computers for the best price, for the best value, not to show off.

JJW: At this show, you are displaying not only the 520ST package, but also a 260STD with 256K RAM, operating system on ROM, and a built-in 3.5" disk drive. What prompted you to include the 260STD in your planned product line?

Tramiel: We feel that there are different buyers in this marketplace...people who like to buy from K-Mart and people who like to buy from specialty stores, so we went ahead and designed two different kind of machines. There is the total system like the 520 which will be sold to specialty stores and a system like the 260 where the mass merchandiser, if he wants to, can buy it. It was strictly to be able to produce the volume and to satisfy our customers.

JJW: The 520ST will initially have its operating system laoded from disk into RAM. Do you hope to put it on ROM at some future point?

Tramiel: The 520 will be on disk only (NOTE: Atari has since announced that the Operating System WILL be available on ROM for the 520ST. Anyone purchasing the 520ST prior to the ROM availability will receive the Operating System on ROM. -JJW). We will definitely have new machines constantly. Our aim is to continuously improve the product line. We intend to show at Comdex this year an even higher graphic machine.

JJW: Would that be the 32-bit machine?

Tramiel: No. We intend to keep the ST as the basic machine. What we will do is we intend to have an expansion box. In that expansion box we intend to put quite a few boards. One of those boards will be a 32-bit board. Not a machine, but just a board. It will

turn the ST, which you own today, into a 32-bit machine if you want to.

JJW: That is exciting. Do you have any problems with me publishing this?

Tramiel: No, go ahead...if I did I wouldn't have told you. You are the first one to be hearing this because to me, people like yourself being part of a club, you are my boss. You are the end user. You are the people that I am working to produce a product for.

JJW: Speaking collectivly for other users, we appreciate it (NOTE: I subsequently asked Leonard Tramiel what processor will be mounted on the board. He said Atari is not ready to announce that information). You are showing an early prototype of CD ROM here that seems to be generating quite a bit of interest and excitement amongst the people who have seen it. Earlier today I was walking around the CES looking at other displays and it seemed I could always hear "Atari" wherever I went. I couldn't key in on exactly what they were all saying, but that word always catches my ear. You currently have a 20-volume encyclopedia stored on a 5" compact disk and the retrieval rate is astounding. What other applications do you see for the CD ROM?

Tramiel: There are many. They can be used for a law library of any state of the United States. You could have the whole Library of Congress with every book that's been published in the last 200 years. A lot of hospital information which is all public information for doctors. Instead of having to go into a data base in Minneapolis, he can have it right on his desk. There are hundreds and hundreds of public domain applications that could be put on that ROM.

JJW: So you see it for use initially perhaps as a professional reference device as well as an institutional

reference device like for schools and colleges.

Tramiel: Exactly. And I am hoping that this is one service that we can sell to remote areas in other countries where people could have a whole library, like 42nd Street and Fifth Avenue.

JJW: It really brings to the present the concept of sitting down at a computer and being able to call up a wealth of information, something I thought was still years away.

Tramiel: Exactly. That's the whole idea, we are trying to bring it forward. I am trying to take away the "black box" image, that it is "not available"...it IS available.

JJW: Tell me about peripherals for the eight-bit line.

Tramiel: We will be expanding our drive capacity. We will have a 3.5" disk drive with a half-megabyte and one megabyte in the future. We have a number of different printers, including a daisy wheel printer. The whole idea as far as the eight-bit line is concerned is to keep that product alive and expand it. As far as beginners, as far as education, as far as people who don't have much money, the eight-bit line is a fantastic product. We will continue producing it and expanding it. I'm hoping in 1986 or even the end of this year to have a 256K eight-bit machine with a built-in drive.

JJW: 5 1/4"?

Tramiel: No, 3.5". We want to keep all those products alive and build on the software.

JJW: Perhaps you've just done it for me, but could you describe your vision of the ideal Atari personal computer. If you could just point at the table

and it would be there, what would it be like?

Tramiel: It would not be on the table. My ideal Atari computer of the future is to have a television with a remote keyboard to be your computer.

JJW: I've respected your work both at Commodore and especially now with Atari. I've read the book "The Home Computer Wars" which I took to be the Jack Tramiel success story, rather than being the Commodore story or the Michael Tomczyk story. I got out of it a greater admiration and respect for you. Have you read it and what do you think about it?

Tramiel: I did read part of it because he is an associate and a friend of mine. He asked me to read it and give him comments beforehand. I did not want to give him any comments and I did not give him any comments. It's the way he interpretted the way I have operated and there are many paragraphs that are not correct, but that's the way people write.

JJW: Would you say he captured the flavor of Jack Tramiel?

Tramiel: I would say about 80% he did.

JJW: Could you run down the expected availablity dates and prices for the current planned line of Atari products?

Tramiel: The 520ST system (512K RAM, half-megabyte 3.5" disk drive, & high resolution monochrome monitor) will be sold in July retails for $799. The 260ST will be available in October or end of September and we'll have 2 machines...one will be $395 without the drive and $495 with the drive.

JJW: What about the other monitors that will be available for the ST's?

Tramiel: In case you would like to

have a color monitor, for $200 more you will be able to get the color monitor instead of the monochrome. So for the black & white, it is $799, with the medium-res color monitor it is $999.

JJW: And the color monitors will be available in July also?

Tramiel: Yes.

JJW: James Copeland (Vice President of Marketing) in a staff meeting I attended the day before the opening of CES, said that Atari has some plans and directions that Atari would like us, the user groups, to take with Atari distributors and mass merchants for which Atari is prepared to help support those user groups. Could you elaborate on those plans and what kind of support is planned for cooperative user groups?

Tramiel: I really am not familiar with what exactly he said. I believe very much in sex. When I mean sex I mean for people to be involved...that's what I call sex. When I have a question to ask, "Is this machine good?", "Do people like it?", I like to go directly to the users and ask them those questions. Like I am trying to offer you the 520ST first...to find out what is going on. If a retailer needs help, we don't want to go out and hire some models, but to find a way how to give this money to your club so that you can really help each other and at the same time to try to help that retailer to sell the product. And as you know who he is selling to, you will get that many more members and we will pay you for that effort so you can use that money for improving your club. That is what I was trying to tell Jamie (James Copeland) and now he is trying to go forward on it.

JJW: I was asking David (David Duberman, Atari's User Group

Coordinator) about the same thing. He said that the plans are not really defined just yet.

Tramiel: I am giving you what the aim is. The aim is that you people in the next 2 or 3 years, with the computers coming out, can help the people that do not know computing by bringing them to the users groups.

JJW: I agree. I was in a store about a month ago where a man just bought an 800XL, 1027, 1050, AtariWriter, etc. While the sale was being written up, I introduced myself and asked if he knew anyone that could help him with any questions or problems he might have in getting his system up and running. He said no, so I gave him my name and number and told him about a couple of the user groups I belong to and invited him to attend our meetings. I don't want to take up much more of your time, in concluding this interview...do you have a message that you would like to convey to the Atari users that will be reading this interview?

Tramiel: The message I have for them is a very simple one. I appreciate all the patience they have had over the years. Now we are here, we are producing the best products and I hope they will be as proud of us as we are of them.

JJW: Thank you.

Does anyone know how similar the internal structure of GEM is to the MAC ? Does it have an event manager, etc. Does it use the concept of a resource file ? Did Atari make use of the unimplemented instruction trap of the 68000 like apple did, to speed up system calls. The main point of these questions being, how easy is it to port Mac software to run under GEM, and will people who know the internal structure of the Mac toolbox be able to easily write code under GEM ? Is anyone on the net currently writing software for GEM ?

Has anyone heard whether or not Atari or DRI will come out with an 'Inside

GEM' ? And if so, how long will we have to wait ?

Thanks in Advance...
David Rowley.

   Here is a message I ran across on a local bulletin board. Has anyone

else had this problem?

==========

I've have a problem with DOS 2.5 in enhanced density mode. When the disk is very full (exceeding the old single density boundry) and you do a BASIC SAVE command which replaces a file located in the extended disk area, the file is actually written starting at sector 1! This has the usual tendancy to make DOS and DUP and the directory real sad when you write over them. Of course you cannot reboot from this disk again. The boot sectors are always killed. Depending on how large the SAVEd BASIC program was determines whether DOS and DUP are smashed.

I got the DOS 2.5 kit from CompuSlave. It works just fine in single density mode. And I haven't noticed a problem in predeleting (or renaming) the original file and then SAVing the new copy to disk.

Has anyone else experienced this phenominon? I can reproduce at will and use one of the DISKDX programs to examine the directory pointers. I suspect the logic is still checking the old 707 sector size and assuming anything over that must be a mistake, so resets the sector to the beginning.

==========

If anyone else has seen this problem or knows of a solution, please let us know.

Ok all you Atari ST watchers... according to this article, the smaller models will have 256K RAM and GEM & TOS built into ROM, and the ST520 will have 512K but GEM & TOS will *not* be in rom, giving a 256K of usable RAM on the ST520 (after GEM & TOS are loaded). So... what is the difference between buying the smaller model or the larger model? It seems as if they both ultimately have the same amount of usable RAM! I am not referring to updates to the 520ST where GEM & TOS will be built in, but rather to the machines available now (or soon). Why buy the present 520 over the present 260?

Thanks,

Steve Sanderson

Subject: Random number generation

I would appreciate receiving any information people may have about the Atari random number generator (algorithm used etc.). If people also know anything about the random number generator on the Apple, Commodore 64 and/or IBM PC, I would be very interested in that information.
If there is sufficient response/demand, I will summarize to the net. Many thanks in advance.

The ST520 has the advantage of more memory if you don't use GEM, the 260 doesn't give you that choice. The ST520's GEM should also be easier to fix in the event of errors (which are to be expected).

Besides, I don't think you should ignore the ST520 ROM upgrade possibility. I suspect that someone, if not Atari, will make use of it.

001 03/20/85 DRI SHIPS GEM

Digital Research Inc.'s (DRI) new Graphics Environment Manager (GEM) system software was shipped as scheduled to original-equipment manufacturers (OEMs) February 28, the company announced March 11, 1985.

The concept of a graphics user interface was first developed for the Xerox Star, then used on the Apple Lisa and Macintosh, and now used on GEM software. GEM runs on any computer based on the Intel 8086 family of microprocessors and the MS-DOS or Concurrent DOS operating system.

"Now that GEM has shipped, an extremely large number of personal computer users will have access to the latest user-interface technology," said John Rowley, president of Digital Research. "And they can be assured of a wide range of application programs as more than 350 independent software vendors (ISVs) worldwide have been trained to write GEM application software.

The following OEMs have received GEM software for use with selected models of their personal computers -- Applied Computer Techniques / Apricot Inc., Northern Telecom, CONTEL/CADO, Texas Instruments, Epson America and Commodore. Digital Research has also transported GEM to run on Atari's new line of ST computers based on the Motorola 68000 microprocessor. Other OEM agreements are in progress with manufacturers of both high- and low-end microcomputers.

In addition, a number of ISVs are writing applications to GEM. These include Lifetree Software, Spinnaker Software, Thorn EMI, Hayden Software and Sierra On-Line. Their products span a range of applications from educational software to office-automation programs.

Active ISV Support

To provide ISVs with the level of support they need to produce GEM-based software, DRI offers a comprehensive ISV program. Included in the GEM Programmer Support service are the GEM programmer's toolkit, which contains GEM software and a complete IBM PC development environment, a toll-free number for technical support and a Compuserve account to keep ISVs up to date on GEM. The price of these tools and support is $500.

GEM-based applications will run on any system equipped with GEM. ISVs can license unlimited distribution rights from DRI to bundle GEM software for the IBM PC family and 100 percent compatibles with their applications for $1000 per year per title.

04/15/85 WEST COAST FAIRE

The West Coast Computer Faire

By
Arthur Leyenberger
Parsippany, New Jersey

Copyright (c) 1985 by Arthur Leyenberger
March 31, 1985

Good news for Atari computer users! Atari is on track with the production of the new XE and ST computers. This was one of the themes of the recent Atari Worldwide User Network (WUN) held in conjunction with the 10th West Coast Computer Faire in San Francisco. The XE computers have already been shipped to distributors and the ST machines will have been shipped by the time you read this. Good news, indeed.

For Atari users, the weekend consisted of two main events: the Computer Faire itself and the WUN kickoff meeting, both held in San Francisco. Although Atari did not have an exhibit at the Faire, they were kind enough to provide two local Atari User Groups with XE and ST computers, freebies, brochures and demo programs.

User Groups Pitch In

The San Leandro Computer Club (SLCC) and the Atari Bay Area User's Computer Society (ABACUS) both displayed the new line of Atari microcomputers at the Moscone Convention Center. This was the first showing to the general public of the computers manufactured by the new Atari Corporation.

Both the 8-bit and the 16-bit products were represented at the booths. A complete 520ST system was up and running, consisting of two 3-1/2 inch, 360K storage, mini-floppy disk drives, the new Atari analog RGB monitor and

the two-button mouse. This was my first chance to get some actual hands on experience with the powerful 16-bit computer and I am excited. I was especially impressed with the mouse. Unlike the MacIntosh mouse that has an uncomfortable amount of rolling resistance, the ST mouse moved smoothly and felt natural in the hand. Since the mouse plugs into one of the joystick ports on the side of the machine, it won't be long before we see it as a peripheral to the older 800 and XL computers.

Two Atari 130XE computers, each with 128K of memory were displayed. Both XE computers were production units, sporting the new parallel bus (see photo), new keyboard and complete compatibility with the older 800 and XL series computers. DOS 2.5, being developed by OSS, was shown as was the RAMDISK software that uses a part of the 128K memory to simulate a very fast disk drive. The XE machines have a crisper feel than the current XL computers but I am sure I could easily get used to it.

Tom Bennett, "show coordinator" of SLCC had done all of the legwork to get Atari to come up with products and promotional material for the show. Bob Barton, vice president of SLCC, somehow-- he wouldn't tell me how-- managed to convince Atari Software president Sig Hartmann to provide a 520ST computer for a raffle. Tickets cost $1 apiece, with all proceeds going to a local charity.

The ABACUS group was invited to attend the Faire by SLCC and together they had what looked like the most popular, and busy, booths at the entire show. Atari has promised user group support for several months and it is now starting to take shape. Not only did Atari provide the machines, they have also hired a new User Group Coordinator to help User Groups everywhere.

His name is Dave Duberman, a name very familiar to many of you. He is now Atari's main User Group contact person. Dave has worked for Antic magazine and Synapse and is very knowledgeable about both the old and new computers. Dave was on hand at the Faire demonstrating the features and capabilities of several XE and ST computers. I'll mention more about how Dave will be helping User Groups later on.

Atari Comes Through

Atari also came through at the User Group meeting held at Antic. Sig Hartmann (software), Sam Tramiel (hardware), Leonard Tramiel, Neil Harris (Atari Explorer), Richard Fritch ("Mister ST"), John Skruch ("Mister 8-bit computer"), Dave Duberman (user group support), and Tom Brightman (Vice President of engineering) were all on hand to answer questions and show support. Joseph Lyons and Frank Schwartz from Enhanced Technology Associates, a music/software/hardware firm in New York City, were also present with multiple keyboards using the Atari computer to demonstrate the MIDI interface. They were friendly folks, willing to answer questions and explain the ins and outs of the digital music world. They also presented a 20 minute MIDI-Atari concert that was outstanding.

The Worldwide User Network

The seeds for WUN were probably planted in August 1984 at the first

'Taricon sponsored by MACE and CHAOS. There, AUGI (Atari User Groups International) was formed to help the user groups speak with one, solid voice with Atari and other manufactureres. An initial mailing to User Groups was done by AUGI last fall to obtain some financial support and interest. Unfortunately, the needed manpower and focus were not available by the few individuals trying to get AUGI off the ground so AUGI is currently in limbo.

Although still in its infancy, WUN is a semi-formal, non-commercial enterprise whose stated goals are the dissemination of Atari-related technical information, new product updates and general coordination of Atari users and User Groups.

The preliminary proposal is to have a board of directors made up of representatives from Atari, Digital Research, the CompuServe Atari SIG, Antic and three user group officers drawn from the East, Central and Western United States. Specifics are not yet available, but you will be hearing more about WUN from your User Group Officers.

As of March 20, 1985, over 125 User Groups have responded to the WUN questionnaire. Invitations to the WUN inaugural meeting on March 30 had been sent to all 125 of these respondees. Dozens of user groups were represented at the meeting. If your User Group has not yet joined WUN, get in touch with Antic for a questionnaire, complete it, and send it back, together with your club's newsletter. You will then be added to the WUN roster.

Other noted attendees at the WUN meeting included Bill Wilkinson of OSS, Ron Luks from SIG*Atari, Mike Mock from Indus Disk Drives, Kirt Stockwell from MPP, Rob LaTulipe from Digital Research and Bill Holt from Broderbund.

Atari Q&A

The best part of the WUN meeting, aside from the excellent salmon and champagne, was the chance to hob-nob with Atari executives and find out what is really going on. The question and answer session proved to be quite informative. Here are some of the highlights.

Sig Hartmann led off the session by saying that Atari has the best hardware on the market. After a hearty round of applause he finished the thought by saying that without software, they have nothing. Within the 2nd quarter of 1985, Atari will offer a wide range of software for both the XE and ST computers. These products will cover business, productivity, education and recreational categories. Sig also asked for software authors to keep Atari in mind as they are developing and writing their new products.

Sig drew a big laugh when he introduced Sam Tramiel by saying that Sam was more qualified to answer questions. It seems that if Sig gave an answer, he would still have to answer to Jack Tramiel but if Sam said it, it would be okay. Sam commented that the first of the 130XE computers were shipped during the last week of March, thereby making their previously announced schedule. The 520ST computer is still on schedule and will be shipped at the end of April or in early May.

Next, Dave Duberman and Neil Harris were introduced. Dave asked that User Group Presidents contact him if they feel Atari can do something for them. He mentioned that Atari does currently have a BBS (408-745-2504) and he looks forward to interacting with the User Groups. He also offered his own number (408-745-4204) and said that eventually he will be coordinating some type of Atari road show whereby Atari representatives will attend User Group meetings across the country giving demos and answering questions.

When asked if there will, in fact, be a 65XE, Sam Tramiel said that it is currently being shipped in Canada. The 130XE has been shipped in the United States and will be followed by the 65XE. John Skrutch was asked when the Learning Phone (previously called the Plato Cartridge) would be available and he said it would be out in May. The delay was apparently due to negotiations that had been taking place with Control Data. According to Skrutch, the Learning Phone will come with a free 1-year subscription and an hour of free connect time.

Asked about software pricing, Sig Hartmann said that most of the software will sell for under $50. However, some of the more powerful programs will be under $100. Sig was also asked who had bought the ST development packages. These packages consisted of a 520ST computer, two 3-1/2 inch micro floppy disk drives, a 15 megabyte hard disk, a RGB color monitor and a high-resolution green monitor. This system, costing over $5000 and including development software, apparently has been purchased by most of the leading software vendors. The list of some 38 companies includes: ANALOG Computing, Infocom, Synapse, Broderbund, Microbits Peripheral Product (MPP), Electronic Arts, Microprose, SubLogic, Matrix Software, Lifetree and Hayden Software. There are also five machines in Europe being used for software development.

Sam Tramiel was asked about the 32-bit computer that Atari had announced would be introduced in Hanover, West Germany in mid-April. He said the machine is being worked on right now and will contain the National 32000 microprocessor. However, it will not be ready for the Hanover Show. Instead, it should be ready by June. Just about all of Atari's effort is being put towards getting the ST out the door. He also said that it may not be announced at the June Consumer Electronics Show because it really isn't a CES type of product. This machine is currently aimed at the vertical and specialized workstation market in the high-end personal computer category. Other computers already competing in this market include the AT&T Unix PC and the IBM AT.

Another question was raised concerning languages for the ST computer. According to Sig, Logo will be contained in ROM, within the ST computer. BASIC is currently being developed by Digital Research and will probably become available this summer. Forth will also soon become available. In fact, Forth was being demoed at the User Group booth at the Faire. Other languages currently planned are C and Assembler. Sig said that if there is sufficient demand for a language, Atari will produce it.

One User Group representative asked Sam Tramiel about what Atari plans to do about the education market. Sam responded by saying that plans are still

being made. However, the school market looks very promising and that some effort will be made to enter that market at a later time. A separate department has already been set up to take care of the needs of the educational market.

Sam announced that Atari plans to spend 10 percent of their sales on advertising in response to a question concerning Atari's visibility. The first major ad campaign will probably begin sometime in June and Atari may use User Groups in some way as part of its advertising.

A question about Atari DOS 2.5 was raised. John Skrutch announced that DOS 2.5 is currently being boxed together with 1050 Disk Drives and is available to current owners of DOS 3.0. Every User Group will receive a copy of DOS 2.5 to be freely distributed (on non-commercial programs).

DOS 2.5 is very similar to DOS 2.0. The major difference is in the Format command. If the menu item "I" (format disk) is selected with a 1050 attached, the disk will be formatted in dual density (140K) format. Menu item "P" will allow you to format a single density disk even if one 1050 is attached. If no 1050 disk drives are connected to your system, the "I" option will format disks in single density format.

John also talked about Atariwriter+. He said it is basically Atariwriter, with just about everything they could think of or that has been suggested in the last two years. It includes 80-column editing (to work with the Atari 80-column monitor which will plug into the serial port), a 36000-word spelling checker, file compatibility with Atariwriter, a mail-merge function and built-in printer driver function.

The BIG News

Sam Tramiel made an amazing statement in response to one of the questions. He said the current plan is to have the User Groups buy the first 520ST computers. Atari would then use these first owners as the test market for the new machine by asking them to help to debug it. If a bug is found and a user suggests a workable fix, the user will be rewarded for his or her efforts. The plan may also include giving a rebate back to the User Group for each machine purchased. This plan may actually be in place by the time you read this.

Also, the 520ST is not currently scheduled to be sold through mass merchandisers like K-Mart and Toys 'R US.

The Faire

The West Coast Computer Faire is the largest computer user show in United States. Over 300 exhibitors were showing software, hardware, peripherals and services in the brand new Moscone Center. The Faire itself has changed somewhat in the last two years. Before, it was primarily a hackers show and is well known for launching the careers of the Apple superstars, Wozniak and Jobs.

Now, such companies as IBM, AT&T, Epson, Kaypro, Apple and many others are

attend, brining with them a certain business flavor. But there are still some interesting things to be seen, even for Atari users. As mentioned before, Atari did not attend but were well represented by the two local User Groups.

One of the most interesting booths was Microbits Peripheral Products (MPP). MPP has supported Atari owners for years and is one of the few "oldtimers" in this young computer business. They were showing everything from hard disks to inexpensive 1200 baud modems. MPP has two hard disks, a 5 megabyte and a 10 megabyte system. The 5 MB system will sell for under $1000 and includes the hard disk interface, hard disk and software. The 10MB system will probably sell for under $1200. If you already have a hard disk, then you can buy the hard disk interface for under $250. I saw the 10MB system working with and 800XL and loading files is fast.

MPP will also be introducing a 1200 baud modem for the Atari that will sell for under $200. That price will include terminal software. Kirt Stockwell, Technical Support Manager, also told me that they are currently working on a brand new telecommunications program that will run on everything from Atari STs to IBM PCs to Atari 800s. The hard disk systems and modem will be available by the time you read this.

Another product Kirt told me about was their Micronet networking system. This net will handle up to eight Atari computers running off of one set of peripherals. Standard Atari SIO peripherals may be used for a very cost-effective multi-station Atari setup. Kirt said that an eight-workstation arrangement with Atari XL computers, color monitors, one set of peripherals and Micronet would cost roughly $3500, about one-third the cots of s similar Apple setup.

Another piece of hardware, appealing mostly to hackers, is a product called Microport. This is a breadboard which interfaces from the Atari computer to the real world. It plugs into the parallel port on either an XL computer or a 130XE and gives you eight control channels. It will sell for $50 and be available by the time you read this.

Another intriguing product at the Faire was being exhibited by a small Oregon company named Covox. They have a voice recognition and voice synthesis unit for Apple, Commodore and Atari computers. Called the Voice Master, it lets you record words in any language using your own pitch and accent and have the program later recognize and speak the words. Included in the $90 price is another program called the Voice Harp. This program lets you perform, compose and write music simply by humming or whistling into the microphone. Seeing (and hearing) it in action is truly uncanny.

The Voice Harp lets you produce various tone qualities, different keys and multi-note harmonies. You can even see the notes scrolling on the screen on a musical staff as you hum or whistle. The results of your composition can be edited, saved and even printed. I can't wait to get my hands on the Voice Master to do a full-scale review.

Broderbund Software was at the Faire to recruit new programming talent to add to their already excellent stable of software authors. Their product

development staff was available to talk with software developers and to present existing Broderbund products. One person that many User Group members may already know is Bill Holt, the Product Development Ambassador. Bill's job is to travel around the country visiting User Groups to demonstrate Broderbund's software titles and to help recruit new talent. If Bill has not yet visited your User Group, feel free to give him a call at (415)479-1170. He will be happy to arrange a visit.

Spectrum HoloByte is a small company that makes an excellent submarine simulation for the IBM PC and compatibles called Gato. I have spent many hours searching for, and destroying, WWII Japanese Naval vessels. They have just announced a MacIntosh version and a high-level company source told be that they would have a version for the Atari ST computer by the end of the year. Gato is one game worth waiting for.

I enjoyed attending the West Coast Computer Faire and the Worldwide User Network Meeting. I think a lot of new, exciting information was obtained that clearly shows that Atari is here to stay and that they intend to support Atari users and User Groups. I also saw evidence that other software and hardware companies are finally beginning to take Jack Tramiel and the "JackIntish" seriously. It all adds up to good news for Atari users.

The End

In Analog's attempt to bring you this information as accurately and timely as possible, this entire article has been written at 36000 feet, on a red-eye special flight from San Francisco to New Jersey. A Radio Shack Model 100 lap computer was used to write the article, whereupon it was uploaded to an Atari and printed using Atariwriter. Computers sure are productive tools!

05/01/85 ATARI TECHNICAL MANUALS

Atari has announced that the popular technical publications on Atari computers are still avilable from the Atari Customer Service Department. Their address is:

Atari Customer Relations
P.O. Box 61657
Sunnyvale, CA 94088
Attn: Documentation

The publications available and their prices are:

De Re Atari.....$19.95
Technical Reference Notes..$29.95

The Demopacs available are:

1. Strings & Formatting
2. Data File Processing
3. Programming Examples
4. Atari Color Graphics
5. Advanced Graphics
6. Advanced System Features
7. Some Special Features
8. Software and Hardware Timers
9. Logo Info Pac
10. Logo Demo Pac
11. Logo Printer Pac
12. Touch Tablet Pac

All Demopacs are $1.00 each.

05/08/85 ATARI AT COMDEX

Permission granted to reprint this article if following statement appears in reprint:

"Entire contents copyright (c) 1985 ANALOG Computing Magazine. All rights reserved"

Atari Pursues Dealers, Software Developers at Comdex

(May 7) Atari Corporation was in full force at Comdex this week, pursuing software developers and computer retailers with vigor.

In attendance at the Atlanta, Georgia-based computer show were Jack Tramiel, James Copland, Sig Hartmann and several other Atari employees, spreading the gospel of the new Atari, "Power Without The Price."

At a press conference, Atari officials answered numerous questions concerning both the XE and ST line of computers, future marketing plans, as well as current strategy.

James Copland, Vice President of Marketing, kicked off the press conference by explaining that "Atari decided only five days before the show to attend Comdex." Copland stressed that Comdex was a show in which Atari could court specific distributors, both hardware and software, software developers, and mass marketers. In that regard, it made more sense for Atari to attend Comdex than to compete with stereo manufacturers at CES.

After Copland's talk came Sig Hartmann, President of Software. Hartmann said that "around 230 companies" were developing software for both the 8-bit XE and the 16-bit ST computers. When quizzed about the number of packages available, Hartmann replied that he expects there to be "over 100 pieces of software" available for the STs by September. ST systems for software companies are now being shipped at list price, a substantial reduction from Atari's original (and unpopular) ST package price of around $5000.

As per earlier announcements, the first STs are to be shipped to Atari user groups for beta testing in a week or two. BASIC and Logo will be included, although we hear conflicting reports as to whether GEM will be on ROM or disk. The first STs for the general public are to be shipped in July.

Among the software being developed for both the XEs and STs are spreadsheets and other applications programs, from various manufacturers. VIP Technologies, of Goleta, CA has developed a package for the XE called VIP Professional. According to the company, VIP Professional combines all the features of Lotus 1-2-3 with some additional features, all for under $100. The program can be either mouse or keyboard-driven, and utilizes icons and "drop down" menus, similar to GEM on the ST. The program is

slated for delivery in July.

For the ST, Haba Systems of Van Nuys, CA has two programs: Haba Works, with a series of applications, such as WORD, FILE, CALC, GRAPH, COM, and HIPPO C COMPILER. Haba Solutions comes with such files as How to Start Your Own Business, How to Create Your Own Legal Will, Business Letters, Business Forms, and the Haba Check Minder. The programs retail for $59.95 and $49.95 respectively.

In a joint announcement, Atari and Rising Star Industries, of North Hollywood, CA, intend to market Rising Star Software products for the ST. The products will be distributed through Atari's dealer/distributor network.

According to Rising Star president Gale Carr, the company is converting its Valdocs line of integrated applications, to be made available on Atari hardware both as a complete package and in individual software modules. Sig Hartmann stated that "We knew from the start that the price/performance advantage of our hardware would only be half the battle. The bottom line is the utility per dollar we're bringing to the buyer; that's why others have lacked in this market, and it's also why Rising Star's software tools are a valuable asset."

Rising Star's integrated color graphics modules, Valdraw and Valpaint -- using Atari's high-resolution color display -- are marked for availability with early shipments of the computer. The company's electronic spreadsheet and other applications are scheduled to follow shortly therafter.

In hardware news, one of the most amazing announcements concerned Atari's marketing plans for the 520 ST. Apparently, there will be two different versions of the ST: one for mass marketers and one for computer stores. Internally, the machines are to be identical -- only the cosmetics of the machine are to be altered. The mass market ST would be the original configuration, whereas the computer dealer version should have a different keyboard and case. Computer retailers will sell a package consisting of the modified ST, a monitor, and half-megabyte drive for $799.

As far as future projects are concerned, Atari is working on a CD (compact disc) ROM, able to store 512K of memory, for under $500. This CD ROM, as well as a new 3 and 1/2 inch drive, are being developed in conjunction with North American Philips, the Netherlands-based electronics giant. Atari owners may recall that Philips' name was tossed around early last summer as a possible buyer of Atari, before Jack Tramiel and crew took Atari's reins.

The subject of Atari's 32-bit computer was not ignored by the press, either. Atari's rumored "CAD/CAM" system was referred to as a "graphics workstation" by Jack Tramiel, who added that the machine should be released "late this year or possibly early 1986." This would make it just in time for the January Consumer Electronics Show in Las Vegas. The 32-bit machine will be sold only through computer stores. At a private dinner for members of the press last March, Leonard Tramiel told ANALOG Computing publisher Lee Pappas and managing editor Jon Bell that "the 32-bit machine is a reality." While Tramiel would not confirm what CPU chip the machine would

have (either the Motorola 68020 or the National Semiconductor 32032) he did have an interesting anecdote about the machine. Apparently, Atari's engineers had hoped to get several prototypes of the 32-bit machine working specifically on developing chip designs for Atari computers, including the STs. Unfortunately, the engineers couldn't work on the 32-bit machine at the expense of working out any bugs on the ST. Instead, the engineers made use of a rather extensive amount of chip development and design equipment left over from the old Atari.

And finally, Atari's decision not to have a display at the Consumer Electronics Show in June was met with negative publicity and rumors concerning the company's financial state. Jack Tramiel emphasized that Atari did not bow out of CES "simply to save $500,000", but that Atari would be represented by a private press conference in Chicago. It should be pointed out that a number of hardware and software companies (Infocom, Electronic Arts) are also not attending the show, but are instead having private press showings and parties to promote their products.

Additionally, Atari officials "lack of comment" over the decision not to have a display at CES was due to said officials attending the Hanover, West Germany Computer Fair. According to sources at the Fair, the showing of Atari's ST computers was "a smash." Overseas dealers and computer owners are reportedly ecstatic over the ST, citing its power, the GEM operating system, and most importantly, its cost. Foreign buyers who have been looking at the Macintosh with envious eyes but can't afford its high price (especially considering the strength of the American dollar) are considering the Atari ST. Jack Tramiel said that he intends for fully half the ST market to be overseas.

In conclusion, the message from Atari at Comdex was, "Today, the U.S. Tomorrow, the world!"

05/28/85 ATARI SHORT SUBJECTS

News from Atari has been rather sparse lately, but here are a few noteworthy items on our favorite computer company:

130 ST discontinued

The 130ST, Atari's low-end 16-bit computer, has officially been discontinued. The 130ST was to contain 128K of RAM, as compared to the 512K of RAM contained in the larger 520ST computer. As this was the only difference in the machines, apparently Atari officials decided to cancel it in favor of the more flexible 520ST.

The 520ST, with its larger RAM memory, can be used to develop software for the ST computer, whereas the 130ST would have been limited to low-memory applications. It is assumed that market research indicated that the 130ST would not be a high-demand item.

ST loses TV output.

In an additional announcement, Atari has revealed that the 520ST computer will not be shipped with a television output connector. It will instead put out only video signals for monitors.

ANALOG Computing believes that the loss of the monitor output is not serious, since the high-resolution capabilities of the 520ST will require a monitor for optimum image quality.

GEM to be shipped on disk.

The Graphics Environment Manager (GEM), created by Digital Research for the Atari 520ST computer, will be shipped to initial users on a floppy disk, not in the computer's ROM (Read-Only Memory), as initially planned. This move is being made for early ST shipments only, and later computers will contain ROM chips for the GEM software. The software will boot into the computer's memory at power-up time, and work normally from that point on. The fact that GEM will be RAM-resident means that 192K of RAM will be unavailable for other uses.

ANALOG Computing received the GEM disk, and it is a vastly improved version of the GEM system received with the 520ST development system. Atari hopes that additional improvements will be made and bugs in the software removed before committing GEM to a ROM installation later this year.

Atari back at CES.

Contrary to earlier reports, Atari has re-evaluated its position regarding the Summer Consumer Electronics Show in Chicago, July 2-5. Atari will have a display at the semi-annual electronics trade show, after all, and ANALOG Computing will be there to cover all the action. Publisher Lee Pappas and East Coast Editor Arthur Leyenberger will be there to provide up-to-the minute coverage for the TCS, transmitting reports whenever possible during

the show. So stay tuned to the ANALOG Computing TCS for information on this important event!

06/10/85 SUMMER CES REPORT

Atari at Summer CES
by Arthur Leyenberger

Permission granted to reprint this article if following statement appears in reprint:

"Entire contents copyright (C) 1985 ANALOG Computing Magazine. All rights reserved."

Overall, the 1985 Summer Consumer Electronics Show was a low-key event. What?, you ask in amazement! How can a show with attendance of over 100,000 people, thousands of square feet of exhibit space and hundreds of high-tech companies be low key? Well, to be honest, there just is not much exciting news to report.

Several companies bowed out at the last moment. Electronic Arts, Infocom, CBS Software and other companies decided that it would be more cost-effective to not have an exhibit at the show. In several cases, these companies decided to rent hotel suites instead at downtown Chicago hotels to court distributors, retailers and the press.

Even Atari was not going to attend the show until at the last minute the CES promoters made Atari an offer they couldn't refuse: a free booth. With the help of some members from the Chicagoland Atari User's Group, Atari made the best of their small conference room exhibit area. However, for the second time in a row, Atari had the most exciting product at the show: the

CD-ROM.

Many of us are familiar with the new Digital Audio Discs, otherwise known as the Compact Disk (CD). These laser "records" can contain up to 73 minutes of pop, click and static-free music. These same discs can also contain an incredible amount of data (up to 550 Megabytes per side). That translates into the equivalent storage of over 1500 IBM floppy disks.

Tom Rolander, VP of Engineering of Activenture, a California optical media company, was demonstrating a prototype of the new Atari CD-ROM player. This innovative product consisted of the entire 20-volume set of Grolier's Encyclopedia on one CD, occupying 58 megabytes. Another 50 megabytes on the disc consisted of cross-indexing information. Every word in the text of the encyclopedia was cross indexed for retrieval purposes.

Amazingly, the text and indexing information (approximately 100K bytes) consumed only one-fourth of the disc's capacity. Rolander said that the remaining space was large enough to hold approximately 5000 high-resolution 720x350 pixel images. The CD-ROM was connected to the direct memory access (DMA) port of an Atari 520ST computer through an interface. This DMA port allows data transfer rates of up to 1.3 megabytes per second which allowed access to the CD to be incredibly fast.

The CD-ROM encyclopedia allows you to request all references to a particular subject or just browse through the text. Having all of the information on one CD rather than having to search through 5 cubic feet of books is an unbelievable convenience. The quick speed of the search is due to the program not searching the actual text but rather searching through the indexing portion of the information.

Regardless of what you search for, the computer screen will tell you how many entries were retrieved and allow you to look at each one. When presented, the information is displayed in black letters on a white background with the key word highlighted in green. Once information is found, the text can be paged forward or backward, copied to a floppy disk for future use or sent directly to a printer.

Rolander said that Activenture was developing the technology under an exclusive agreement with Atari and the decision of who would market the product had not yet been made. The targeted price for this innovative product is $500, but Atari is trying to shoot for about $350. In fact, Jack Tramiel told me that his target price was $150. Consider this: an inexpensive audio CD player can be purchased for as little as $200 today and the CD-ROM/ST interface may cost as much as $100. Therefore an under $500 price is very realistic. The software (encyclopedia, recipe, historical stock market price, and legal data bases, etc.) is expected to initially sell for $100 to $150 but could come down to the $50 range if significant quantities are made.

Other Atari News

In addition to the CD-ROM which is expected to be available in the fall, Atari also announced a new computer. Called the 260STD, this computer

contains 256K of RAM memory and has TOS (The Operating System), which includes GEM, in ROM. It also has a built-in, single-sided disk drive toward the back of the left side of the computer. The disk drive is a 500K (unformatted), 360K (formatted) 3-1/2 inch micro drive. Unlike the 520ST, the 260STD has a TV video output jack on the rear of the computer. The 260STD looks just like the 520 only a slightly deeper (similar to comparing the 1200XL to an 800XL).

The 260STD is the so-called low-end, "mass market" computer that Atari has mentioned in the past and will be sold at such places as "K-Mart" and "Toys 'R Us". The machine is expected to become available in the fall and will retail for $499. This price does not include a monitor.

The 520ST is slated to be bundled with a disk drive and monochrome monitor. The retail price of the package is said to be $800 and the system will only be sold at computer specialty stores.

Sig Hartmann, Atari's President of Software, disclosed to me that the 520ST computer will never have GEM in ROM. It will always be "soft loaded". Currently, the operating system called TOS (The Operating System) and GEM (Graphics Environment Manager) together require about 220K of RAM. Dave Duberman, Atari's User Group Coordinator, told me that Atari is trying to get the size down to under 200K. If this is accomplished, the 520ST computer will contain approximately 300K of RAM after the operating system is loaded versus the 256K of RAM on the 260STD computer. In terms of available memory then, the two machines are essentially identical, especially with regard to the commercial software market.

However, in talking with Neil Harris, the publisher of Atari's Explorer magazine, it seems that GEM may become available in ROM for the 520ST. The 520ST, according to Harris, will contain sockets for the ROM chips so if (or when) they become available, they can be added. This would give the 520ST twice the memory capacity of the 260STD. Only time and Atari can answer this puzzling question.

Atari's third major hardware product was a direct connect, autodial, auto-answer modem that is Hayes compatible. The XM 301 will sell for under $50 and plugs directly into the serial port on all Atari 800, XL and XE computers. It takes its power from the serial port so there is no AC cord to get in the way and routes the dial tone through the TV speaker. The modem comes with XE-Term, a modem program written by Russ Wetmore that uses XMODEM protocol for up and downloading. The XM301 also comes with over $200 of free time on such on-line services as the Source and CompuServe. There is reportedly a similar, 1200-baud modem, that will sell for under $100.

New Software from Atari

Atari was again showing the Silent Butler, a home financial program for the XE computer. Available in July and costing under $50, this program lets you keep track of three checking and 2 savings accounts. It also allows you to categorize your expense items, for later use when filing your income tax. Your own checks may be used on your dot-matrix or letter quality printer using the supplied plastic holder. The program also provides a tickler file

for appointments.

Atari was showing another product exclusively for the 130XE computer. The Professional is a Lotus 1-2-3 clone that will sell for under $100 and should be available by Christmas. It is essentially a spread sheet program that contains data-base type operations such as sorting and searching. The program uses windowing and pull-down menus and will be functionally equivalent to a planned ST version. The Professional is being developed by VIP Software.

Another product introduced at the show was the Home Astronomer. This under $50 product contains over 15000 plotted stars and will allow the user to view constellations, change point of view and move through time. You will even be able to track Halley's Comet.

The Atariwriter Plus word processing program is in the final stages of testing. It is a super-duper Atariwriter that will retail for under $50 and become available this fall. It is expected that existing Atariwriter files will be compatible with the new version of the program.

One of the most interesting new Atari software products is a GEM look-a-like program that will run on all 8-bit Atari computers. Also developed by VIP Software, the program is called, appropriately, GEM Desktop. The $50 price tag includes a mouse. It should be available by Christmas.

Where's the Beef

Conspicuous by their absence, several previously announced Atari software products were nowhere to be found. Infinity, by Matrix Software, was to be an integrated package containing a word processor, spreadsheet, relational database and telecommunications program. It was supposed to be available for both the ST and XE computers and sell for under $100. Whoops!

Another title, long past due regardless of which Atari announcement you believe, is the Learning Phone. Originally called the Plato cartridge, this under $50 program was going to open up the world of Control Data's Plato educational network to Atari computerists. At the West Coast Computer Faire in late March, Sam Tramiel announced that it would be out in April. Now, Atari says real soon. Darn!

The Song Painter, Atari's "music construction program" for the 8-bit computer line was also nowhere to be found. Another program that was not shown was the Shopkeeper. This was to have been a small business productivity tool that included a cash register simulator, expense report, etc. Oh-my-gosh!

Finally, Crystal Castles and Mario Brothers, two games that were both announced at the last Consumer Electronics Show in January, were not shown. Zap!

On the hardware side of the coin, the 130ST has been officially declared "cancelled" as has the 65XEP. The 130ST with only 128K of RAM was considered to have inadequate memory and the 65XEP 8-bit portable was

thought to have no market. There will be little mourning for these computers as the 130XE, 260STD and 520ST computers are all solid products with a healthy future.

ST Software

With the introduction of the new Atari ST computers just around the corner, a logical question to be asked by both experienced and novice users is what kind of programs can I get for an ST computer? ANALOG Computing was particularly interested in finding out which companies are committed to the new Atari computers and what kinds of software will become available for them.

The following companies have announced ST software. This is the first time this information has been made available. The companies and the descriptions of their products are presented in alphabetical order.

Batteries Included, publisher of such well-known products as B-Graph, HomePak and Paper Clip, has announced a major commitment to the new ST computes. Their first GEM-based product, called "IS" for Integrated Software, will consist of a word processor with built-in spelling checker, a combined spreadsheet and graphics package, a database manager and a stock portfolio package. All of the programs will work together in an integrated manner, says director of product development Michael Reichmann. The portfolio package will be the first release and be available in the fall.

Datasoft has revealed that they do have an ST development system and are planning to introduce ST software by the end of the year. Their most likely first ST titles will be Bruce Lee and Goonies.

Electronic Arts is taking a wait and see attitude on the new Atari ST computers. However, Trip Hawkins, president and founder of the company, has said that they are coding their MacIntosh and Amiga programs in languages such as PASCAL and C in order to more easily port them over to the ST should they decide to enter the market. If they did produce an ST product, it would most likely be a newer, more powerful version of Financial Cookbook.

Epyx, although recently supporting the Atari 8-bit market with such excellent titles as the Lucasfilm games, does not appear to be interested in the ST computer. A representative said that they will wait and see how the ST market develops and then decide what to do.

Haba Systems, a West Coast Software house that has previously developed an marketed software for the MacIntosh, has announced that they will be marketing a line of software for the ST computer. Included in this series of packages will be a word processor, database program, spreadsheet and communications program. They also said they would eventually port all of their MacIntosh software to the Atari ST.

ICD, makers of SpartaDOS and the US Doubler Chip told me that they are interested in the ST computer but have no current plans for specific programs. They plan to closely watch the ST market develop and see what is

needed; then step in with a particular product tailored to the needs of users. Tom Harker, president, made it very clear that they do not want to abandon the Atari 8-bit line, especially the 130XE computer.

Infocom has announced that their entire line of 16 text adventure title will become available for the Atari ST computer. No firm introduction dates have yet been given.

Noah Falstein, product manager for one of the new Lucasfilm games being published by Epyx, says that Lucasfilm has no plans for developing ST software. Rather, they will wait and see how the market develops.

A representative for Mindscape told me that they too have no intention of developing for the Atari ST computer at this time. They feel that the Amiga/MacIntosh is a more viable market. However, they would jump on the bandwagon if the ST becomes a success.

Scarborough is another company that is not currently doing any development for the ST computer. They feel, as do several other companies, that the Mac and Amiga markets are where the action is (or will be). And of course, if the ST is a hit, they will join the rush to produce ST software.

Sierra On-Line has announced that they will market the popular submarine simulation game, Gato, for the ST computer family. Gato, originally introduced for the IBM computer, puts you in the captain's seat of a World War II submarine. Your mission: find and destroy the enemy Japanese fleet. I have spent many hours playing the PC version of the game and have recently seen the MacIntosh version. The ST version should be excellent.

Spinnaker is planning on ST developing ST software. Says Seth Godin, "...the [ST] machine is custom made for our interactive fiction games. It has the sound, graphics and memory". He also sees the ST as a strong product and is pleased with the cooperation he has received from Atari.

However, Synapse is taking a wait and see attitude regarding the ST computers. According to president Brian Lee, they have not yet obtained an ST development system and he is unsure of the demand for the machine. If the machine takes, naturally he will jump in, adds Lee.

Next month Analog Magazine will complete our CES coverage by presenting other hardware and software announcements made at the show.

06/18/85 CES WRAP-UP

Summer CES Wrap-Up

by Arthur Leyenberger

Permission granted to reprint this article if following statement appears in reprint:

"Entire contents copyright (C) 1985 ANALOG Computing Magazine. All rights reserved."

In this article, we wrap up our CES coverage by reporting on other new products from companies exhibiting at the semi-annual electronics show. In past years, each show typically had a theme. Usually informal, and definitely not announced, it was obvious what the latest fad, trend or new products were that year. Previously games or educational software were the themes.

This year no one theme emerged except that several major software companies decided to to attend the show. But looking at the products from the various manufacturers, two central ideas were present: more value for your computer purchase and more mature entertainment products. Also, everywhere you looked, software for Apple, Commodore and Atari computers all used some form of pull down menus, windows and icons. And these techniques were used on 8-bit computers. Here then is what's new from the rest of the 1985 Summer Consumer ELectronics Show.

Activision had several new programs for the Atari. Garry Kitchen's Gamemaker: The Computer Game Design Kit is a programming tool for the creation of your own computer games. Using only a joystick, you select from various menus to choose the different aspects of a game you wish to create. Pre-programmed characters such as an airplane, rocket ship, flying saucer, ducks and a running man are included. The program also lets you select the speed of movement and direction of the characters, background scenes, sound effects and even music.

The Game Design Kit also lets you save your game creations on a separate disk so that you can give them to your friends. Saved games do not require the Design kit in order to run.

Another new Activision game is called Fast Tracks: The Computer Slot Car Construction kit. This is also a do-it-yourself program in which you can

create, edit and save slot car tracks and then race on them. The program is joystick controlled whereby you select from a menu of track sections such as curves, loops and underpasses in order to assemble your track piece by piece. The track difficulty level and the slot car itself can be custom designed to whatever you want. The program also includes several pre-designed race courses to get you up and racing immediately.

Hacker is the third Activision game that was shown at CES. Much like a mystery movie, Hacker has no instructions, goal or guidelines: you simply boot the disk and the program asks you to log on. What you do after that is totally up to you. All you know when you start the game is that you have "accidently" broken into an unknown computer system and have stumbled onto a secret beyond anything you could imagine. With no rules, clues or background information you must find out whose system you have logged onto and what is going on. All Activision will say about the program is that there is a mystery to be solved and there may be several solutions to the problem.

Alter Ego is Activision's game designed for wimps. The program allows the player to vicariously experience living the life of someone else. As you are presented with situations and events, you can respond in any way you want and see how that behavior molds your personality. With Alter Ego, you can consider many different ways you might live in an entertaining and totally risk-free way. After each decision is made and entered the computer narrator explains the outcome and the possible consequences of that choice. Over time the effects of choices made early in life will affect the situations you later face.

The Game Design Kit, Fast Tracks, Hacker and Alter Ego will be available by the end of the year and each cost under $50.

Batteries Included, the Canadian firm responsible for two good programs, Paper Clip and HomePak, was showing a new 80-column cartridge for the 8-bit Atari computers. The BI-80 will work on the XL and XE computers and plugs into the cartridge slot. It is priced at about $80 and will work with a new version of Paper Clip and HomePak due out this fall.

Batteries Included announced that they would send a free BI-80 cartridge to any legitimate software developer, complete with its specifications. This open-minded attitude is refreshing in this industry and perhaps may yield a significant number of programs that will work with this product. A standard may be created in the Atari 8-bit line which is fine with me. It would also be fine with Batteries Included.

Broderbund Software had only a few Atari related announcements. Championship Lode Runner will become available for the Atari computer this fall. Also, their new game Karetaka, will be available for the Atari. Karetaka is unique in that it is the first and only game that I know of that uses film-style cutaway views for the game screens. When approaching an enemy, for example, the screen first shows your player, then it cuts to a view of the opponent approaching, then back to you again. This technique is used effectively in this karate-combat-adventure game.

Another new game shown by Broderbund was Lode Runner's Rescue. This game follows in the footsteps of Lode Runner in that your character must traverse a series of 46 mazes on the way to your goal. You are Alexandra, the daughter of the famous Lode Runner, trying to reach your father's prison cell. Naturally you must pick up keys and avoid the hostile guards on your journey. The game also features a game editor in which you can create your own screens containing elevators, trap doors, enemy guards and rushing rivers. Lode Runner's Rescue will be available for the ATari this fall and cost $30.

Broderbund also announced the Print Shop Graphics Library Disk Two. This $25 disk, available this fall, provides 120 additional designs, symbols and pictures for use with your Print Shop graphic creations. Images in six new categories consist of such items as a tractor, jukebox, microscope, whale and cross. The Print Shop lets you easily write, design and print your own greeting cards, letterheads, banners and signs.

Computer Magic was showing an interesting product that will appeal to robot lovers of all ages. Called Robot Link, this program runs on any Atari 8-bit computer and lets you control Tomy Omnibot and Verbot robots. This software is unusual in that you do not need to actually walk the robot through its series of steps in order to train it to do something. Various sequences can be saved to disk and later reloaded.

The software package also comes with several games that take advantage of the program's unique ability to make one of the Tomy robots move in a random fashion. In addition, Robot Link allows you to have more precise control over the maneuverability of your robot. Robot Link will sell for approximately $40.

A small Oregon company named Covox had an intriguing product at the show. They were exhibiting a voice recognition and voice synthesis unit for Apple, Commodore and Atari computers. Called the Voice Master, it lets you record words in any language using your own pitch and accent and have the program later recognize and speak the words. Included in the $90 price is another program called the Voice Harp. This program lets you perform, compose and write music simply by humming or whistling into the microphone. Seeing (and hearing) it in action is truly uncanny.

The Voice Harp lets you produce various tone qualities, different keys and multi-note harmonies. You can even see the notes scrolling on the screen on a musical staff as you hum or whistle. The results of your composition can be edited, saved and even printed. I look forward to obtaining a Voice Master in the near future in order to do a full-scale review.

Datasoft was showing something old, something new and something borrowed. The borrowed titles shown were licensed originals from other companies. From Atari, Datasoft is now marketing Pole Position, Pac-Man and Dig Dug. They are also marketing Zaxxon from Sega. In the something old category, Datasoft is continuing to sell the Conan, Mancopter and Bruce Lee games. For something new, Datasoft announced several games for the Atari computer. Mr. Do and Pole Position II have been around for a while but are now making their debut on the Atari computer. Mr. Do is similar to the popular arcade

game. Pole Position II is also an arcade translation, complete with four tracks and the ability to create your own track. Another acquired arcade license is Elevator Action by Taito. Elevator Action and Pole Position II will be available in the fall and retail for about $30.

Three entirely new game were previewed by Datasoft. Zorro, based on the famous character created by Johnston McCulley in 1919, has appeared in the movies, on TV and in comics. Now the computer game arrives with the same villain that we all hate: Sergeant Garcia. The game begins with the abduction of a fair maiden by Garcia's soldiers. Zorro's pursuit takes him through 15 increasingly more difficult screens, including four in the catacombs beneath the mission graveyard. As Zorro, you leap from rooftops, trampoline your way from one floor to another and engage Garcia and his soldiers in duels.

Another new title from Datasoft has a movie tie-in with the new Spielberg film: Goonies. Following the adventures of the Goonie kids in the film, each screen is an elaborate Rube Goldberg type maze. Your goal is to obtain the pirate's treasure while avoiding the evil Mama Fratelli.

Datasoft's third new game is called Alternate Reality. It is a fantasy role-playing game in which you have been abducted by an alien spacecraft and transported to another time and place. In the first episode, "the city", you must learn basic survival skills such as finding food, shelter and money. The goal: return to Earth or seek revenge on your abducters.

Zorro, Goonies and Alternate Reality will be available for the Atari computer this fall. Alternate Reality will sell for $40 while Goonies and Zorro will sell for $30. Datasoft has not been very strong in the Atari market lately but we wish them the best of success with their line-up of highly recognizable titles.

Electronic Arts was not at the show but had a hotel suite in downtown Chicago. They were showing nothing new for the Atari computer at this time but told me that Skyfox, Adventure Construction Set and Road Racing Destruction Set would probably become available for the Atari 8-bit computer line by the end of the year. They have purchased the rights to the arcade hit, Marble Madness and mentioned that a version may appear for the Atari ST computers. Also, an enhanced Financial Cookbook, may become their first ST product.

Epyx Software, the folks who brought you Rescue on Fractalus and Ballblazer, two great Lucasfilm games, were proudly showing two additional Lucasfilm games. The Eidolon, one of the two new games, allows you to become an adventurer on a magical journey. In a kind of inverted Fractalus, you roam throughout caverns populated by trolls, greps and dragons. Your goal is to find the inventor of a 19th century time machine and learn the secrets of its use.

The other new Lucasfilm game is called Koronis Rift. This is really a strategy game in action game clothing. You play the role of a futuristic techno-scavenger who discovers the Koronis Rift: the legendary weapons testing grounds for an ancient race of beings. Unfortunately for you, this

neat technology is guarded by a genetically engineered race of creatures who have outlived their creators. It's up to you to decide what weapons and technology to recover in order to survive.

Both Eidolon and Rift employ Lucasfilm's fractal generators to create ever-changing 3-D landscapes and caverns. These techniques appear to be even better than those used on the first two Lucasfilm games. Explosions look more realistic, objects seem lighter in the distance and more colorful objects appear on the screen. These games will be available in the fall and will sell for about $30.

The latest in the series of sports games from Epyx is The World's Greatest Football Game. As a computer coach, you can play against the computer or another opponent with up to 120 different plays, choosing either offense or defense. The game will sell for about $30 and be available by the time you read this.

Epyx also announced that a new enhanced version of Temple of Apshai will be available for the Atari computer soon. Called The Trilogy, this dungeons and dragons type of adventure role-playing game features 1400 separate chambers, multiple dungeon levels, improved graphics and faster action play. The game will cost $30 and includes the original Temple of Apshai, Curse of Ra and Upper Reaches of Apshai.

A company called Enhanced Technology Associates was demonstrating some interesting products in the back of the Atari booth. They have a product called Virtuoso that allows you to create and edit sounds on the Atari computer. What is unique about their program is that you do not need to read music in order to use it effectively. The program is primarily joystick controlled and you simply draw the melody on the screen. Once this is done, note names can be displayed, timing may be changed and sections cut and pasted for future use.

Virtuoso requires an Atari 130XE computer and will sell for under $50. It will be available by the time you read this. Another of ETA's products is Virtuoso MIDI. This is a two-part product: An enhancement to the original Virtuoso program and a hardware interface. The company says that existing owners of Virtuoso can upgrade to the new product for the difference in price. ETA's MIDI interface will sell for under $150 and the program will cost $50. The MIDI Virtuoso requires an Atari 130XE computer and will be available by January.

Joseph Lyons, one of the partners of ETA told me that they will also be coming out with MIDI Virtuoso for the Atari ST computer by summer 1986. Few details are available now but they are committed to supporting the ST computer.

ICD, makers of SpartaDOS, were showing some interesting products. Their new SpartaDOS Construction Set appears to be the most sophisticated and powerful DOS for the 8-bit Atari computer. The program sells for $40 and offers an amazing array of features including many utilities. When used on the 130XE computer, a RAMdisk is created which can be configured as drive 1-8. Directories can be used, batch files created, individual files or

entire disks locked (protected) and drive speed checked.

SpartaDOS also time and date stamps files and even lets you change these parameters. A disk can be given a volume name and changed at any time. Their are just to many features to mention here.

Another product shown by ICD is their R-Time 8 Cartridge. This is a real-time clock for the Atari computer. Using SpartaDOS without this cartridge allows you to time and date stamp your files but you must enter the time and date each time you power up your computer. With the R-Time cart, time and date information is automatically kept for you. Also, continuous time/date information can be displayed on the screen and is easily accessible from Basic and other languages. The cartridge uses a 5-year battery, sells for $70 and has its own expansion port. That way you can keep this cartridge in your computer at all times and plug other cartridges into it.

Microbits Peripheral Products (MPP) has supported Atari owners for years and is one of the few "oldtimers" in this young computer business. At CES they were showing everything from hard disks to inexpensive 1200 baud modems. MPP has two hard disks, a 5 megabyte and a 10 megabyte system. The 5 MB system will sell for under $1000 and includes the hard disk interface, hard disk and software. The 10MB system will probably sell for under $1200. If you already have a hard disk, then you can buy the hard disk interface for under $250. I saw the 10MB system working with and 800XL and loading files is fast.

MPP will also be introducing a 1200 baud modem for the Atari that will sell for under $200. That price will include terminal software. MPP is also currently working on a brand new telecommunications program that will run on everything from Atari STs to IBM PCs to Atari 800s. The hard disk systems and modem will be available by the time you read this.

Another new product from MPP is the Micronet networking system. This net will handle up to eight Atari computers running off of one set of peripherals. Standard Atari SIO peripherals may be used for a very cost-effective multi-station Atari setup. An eight-workstation arrangement with Atari XL computers, color monitors, one set of peripherals and Micronet would cost roughly $3500, about one-third the cots of similar Apple setup.

A piece of hardware, appealing mostly to hackers and hardware buffs, is a product called Microport. This is a breadboard which interfaces from the Atari computer to the real world. It plugs into the parallel port on either an XL computer or a 130XE and gives you eight control channels. It will sell for $50 and be available by the time you read this.

Mindscape announced that their only new product for the Atari, The Halley Project: A Mission in Our Solar System, is available now. This is a real-time space adventure simulation written by Tom Snyder. Every planet, star or moon depicted in this program moves at the same rate of speed and in the same orbit as they actually do in our solar system.

The Halley Project uses high resolution graphics and attention to detail in

what looks like a very good simulation of outer space. Players must qualify for the top secret "Halley Project" by completing a series of navigational tests. Through the tests and obstacles the program helps the players master facts about our solar system, including Halley's Comet and its orbit. An understanding of gravity, atmospheric conditions, orbital motion, relative size, position and orbits of planets and moons, location of constellation and how eclipses work are all provided. The Halley Project will sell for $45.

Synapse Software, now owned by Broderbund, is reported to be in healthy financial condition. This is evident by their introduction of several new products for the 8-bit Atari computer line. Mindwheel and Essex are two new text adventures announced by Synapse. Billed as ELectronic Novels, these two novels are said to pick up were the printed word leaves off. What is interesting is that you begin these adventures by reading a hard-bound book that sets the stage and describes the characters. Then, you begin the text adventure on your computer as a continuation of what you have just read.

The parser used in these text adventure games is as good as that used by other text adventure publishers. Mindwheel is a journey into the minds of four deceased people of extraordinary power. Off-the-wall humor is used throughout the adventure which adds to its unique quality. Essex is the story of an intergalactic search and rescue mission.

Synapse also announced new versions of SYNCalc and SYNFile+ that will take advantage of the extra memory in the Atari 130XE computer. If you already own either of these excellent products, Synapse is offering a $10 upgrade policy. For $10 and your current disk, Synapse will send you the new improved version of the program. This offer is being done through their customer service department.

Synapse has also announced the SYNCalc Template Disk. Available by the time you read this, this product features 22 different templates for use with the SYNCalc spreadsheet program. Spreadsheet formats and formulas in such areas as stock/bond evaluation, expense reporting, mortgage payment analysis, personal net worth and conversion tables are offered on this $19.95 disk. These templates make an already excellent and useful program even more worthwhile.

Another new product was announced by Synapse. Called Letterhead, this program integrates word processing, an address file and a graphics capability. Using windows and drop down menus, Letterhead allows you to create and save letter formats, create letterheads using multiple fonts and use a tickler-style address file for keeping track of your data. A keyboard, joystick, touch tablet or mouse can be used with this program. Letterhead will be available in late fall and sell for under $50.

[..............]

I heard 2 rumors recently about the Amiga and the ST:

1. The Atari ST runs its Video at 70 hz. This rumor came from the fact that
   someone who talked to a computer store salesperson (in Canada) claiming
   to already have a monitor (wanting to get out of the package deal) was
   told "you don't have one of these, it runs at 70 hz".

2. The Amiga has the capability to gen-lock it's video to an external source.
   If this is true (seen in a recent EE Times) and it works full color (they
   mentioned overlaying on video signals) then I MIGHT be willing to sacrifice
   flicker-free (60-70 hz non-interlaced) for NTSC compatibility. Otherwise,
   anything less that 60hz non-interlaced is unacceptable (screw NTSC).

Does anyone know if there is some place in the northeast that repairs Trak Disk Drives. If you do I would appericate knowing who, where, and how much if you know all of the preceeding information.

Alternately does anyone know where I can get a service/repair manual for a Trak AT-D2 and/or schematics.

The problem appears to be in the touch sensitive circuitry, th drive will not stay turned on.

Also anyone who has access to BITNET, you may want to check out the Atari Forum at CSNEWS@MAINE. It has just been started so feel free to add to it.

Thanks,
Jim Berg

> Steve Sanderson, COSI Texas

According to the West Coast Atari distributer, they don't expect to see
any of the smaller machines until late fall - in time for the xmas rush.

By then, the 520 is expected to have TOS and/or GEM in rom, and you will
recover the ram space.

[Believe it or not, quite a few people I know of could care less about
GEM - on disk or in ROM. And they are ALL going to buy ST's if they don't
buy Amiga's.]

For those interested in the book 'De Re Atari', the latest issue of
ANTIC magazine has a letter from a reader stating that it is available
from American TV Sales for $12.50 plus $4 shipping and handling.
Their address is:

American TV Sales and Service
15338 Inverness St.
San Leandro, CA 94597
(415)-352-3787

According to an ad for Computer Palace, they also carry it for
$17.90 plus $2.90 shipping and handling. Their address is:

Computer Palace
2160 W. 11th Ave.
Eugene, OR 97402
(503)-683-5361
(800)-452-8013 toll free for orders only.

These are some sources in addition to ATARI themselves. Hope this
helps...

[.............]

Hi gang!

I don't know if any of you out there noticed or not, but the May 1985 issue of Dr. Dobbs Journal had a very interesting solids-type graphics package for the C64. It was written primarily in 6502 machine code with hooks to Basic. It would appear that there are few machine dependencies of this package, and I am interested in converting it to run on the Atari. I contacted the author, who was only able to provide me a copy on a C64 diskette. Unfortunately, I only know 2 people who have C64's, one of them dosen't have any kind of standard interface such as RS232 etc., and although the other person has a modem, he knows very little about the associated programs and lives about 1 hr. away driving time. (plus the fact that I know relatively zip about the c64).

I was wondering if anyone out there might be able to assist me in somehow converting the source files of this package to some form that I can deal with. I can make use of the following:

- 5 1/4" Atari
- 8" CP/M-80
- 5 1/4" IBM P.C.
- MacIntosh disks
- 9 track tape (for VAX)
- Modem (if you don't live to awfully far away, or have a suggestion that might minimize the phone bill) I am Hayes compatible (1200/300)

Or, if you can download to UNIX, maybe you could post it to me, etc. If you need the C64 disk, I can mail it to you. Any of the above formats I can then convert to the Atari disk that I need to get the job done.

The source is in about 7 relatively short files (couple of magazine pages max, in the Dr. Dobbs article), and conversion of the few short Basic files might also be useful, as the differences are not that great and the programs are short.

If by some stroke of luck someone out there has already accomplished this feat (for the Atari that is), please let me know, it could save me a lot of headache if we could work something out.

Send me mail if you have any suggestions, solutions, etc., and Thanks!!!

[Oh yeah? Well the same to you!]

After playing Bounty Bob Strikes Back, a sequel to Miner 2049'er,
and only briefly seeing level 8 before my last man got killed off,
I've disovered a few things:

To warp to level 4, on the first screen, right after getting the
flower pot, hold down the START and press 1.

As for the Special Code in the option menu, try the following
and press OPTION after selecting the number:

40 - quick way to fill the high score table if the table is empty.

69 - such a dirty mind!

100 - take a look at Bob after you try this one.

213 - Ah, the old area code of Big Five.

818 - The right area code.

If anyone else has found a code that does something or knows how to

warp to other levels (I was told the next warp was to level 12) send
me some mail.

iThere is a public domain program called VT10SQ. You'll get the
binary version, though its probably written in something like ACtion!
It's fairly commonly available, and emulates an 80 col. screen by
using graphics 8 mode to draw out characters & so on. It runs with both
the 850 & 835/1030 modems thanks to Russ Wetmore etals. new R handler.
Send disk etc. if interested..its is public domain.

[..............]

A friend of mine just gave me a copy of a catalog for 'Computer Palace',
2160 W. 11th ave, Eugene, OR 97402, that includes information and pricing
for the Atari ST line. While disk drives and monitors are not mentioned,
the 130ST is listed at $399, and the 520ST at $599. I gave them a call,
and they are presently taking orders, with delivery to them expected at
the end of this month. They indicated that some people now have them,
and that users groups get first crack. They also indicated that their
backorder level was getting high, and that it would be wise for anyone
who wants one to get their order in soon.

In addition, it was stated that Logo is built in, and Basic is extra in a
80k cartrige.

You can reach their order desk at 1-800-452-8013

JACKINTOSH TO POP UP IN MID-MAY IN CANADA

By Jonathan Chevreau

The new general manager of recently formed Atari (Canada) Corp. of Toronto says its 520 ST, or "Jackintosh," personal computer will be available in Canada in mid-May, one month before it is on sale in the United States.

The Jackintosh, a colour home computer similar to Apple's Macintosh, is the brainchild of Jack Tramiel, who recently acquired Atari Inc. of Sunnyvale, Calif., after being at the helm of Commodore Interational Ltd. of the Bahamas.

Atari Canada, a wholly owned subsidiary, began operations in January under Ian Kennedy, director of sales and marketing and soon to be general manager. He and three other senior executives followed Mr. Tramiel from Commodore to Atari.

In the days of the video game boom, Atari video games were distributed in Canada by Irwin Toy Ltd. of Toronto. Irwin still distributes the 2600 game machine, but the new line of personal computers is being handled by Atari Canada. It is currently operating out of downtown sales offices, but plans to move to a showcase and warehouse in the spring.

Mr. Kennedy projected sales of $35-million for 1985. Atari Canada plans to spend, initially, about 10 to 12 per cent on advertising, with the figure declining to 7 per cent in later months.

No Canadian R and D or manufacturing is expected in the short term. The machines use many North American-made components but are assembled in Taiwan.

While the home computer market has been depressed of late, Mr. Kennedy expects next Christmas to be a lively contest between Atari and Commodore. As well as the Atari model, the market will see Commodore's new Amiga.

The ST's name stands for Sixteen/Thirty-Two -- the number of bits that can be processed by its Macintosh-like processor. The ST resembles the Macintosh closely, employing icons or images, a mouse and pull-down menus.

However, the Jackintosh, and presumably the competitive Amiga, will cost much less than the Macintosh, and will have a colour monitor.

The Jackintosh will cost $1,300 in Canada for a configuration that includes the main processor unit with 500 [sic] kilobytes of memory, a monitor, 3.5 inch disc drive and mouse. Atari also plans to introduce a 15-megabyte hard disc drive that will cost less than $500, a printer for about $350, and an

integrated software package that costs less than $100. The package has word processing, telecommunications, data base management, a spreadsheet and graphics.

Soon the new Atari ST will be coming out. And I am sure those
of you with old atari's don't want to see all the gab about the
new atari ST. And those who do want to hear about the Atari ST
don't want to hear about the old Ataris.
So what do you guys say, a new newsgroup called
'net.micro.atari.ST' or 'net.micro.st' ?
or not?

According to the Globe and Mail (April 5), the new general manager of recently formed Atari (Canada) Corp. of Toronto says its 520ST computer will be available in Canada in mid-May, one month before it is on sale in the United States.

Sales of $35-million are being projected for 1985, with about 10 to 12 percent being spent on advertising initially, declining to 7% in later months.

The basic configuration of processor, 512K of memory, monitor, 3.5-inch disc drive and mouse will cost $1300 (Can.). Atari also plans to introduce a 15-megabyte hard disc for about $500 (Can.), a printer for about $350 (Can.) and an integrated software package for less than $100 (Can.) The package has word processing, telecommunications, data base management, a spreadsheet and graphics.

I don't think this newsgroup has sufficient traffic to split it up. So I vote "no" to net.micro.atari.st

Instead of a new group, why not have the ST owners use the net.micro.mac?
I say this because the new operating system is to be run in the same vain
as the Mac from Apple (please excuse the dirty word).

I think a new newsgroup is called for.

net.micro.mac has a lot of traffic, and postings regarding the ST will
initially be too elementary and general for old mac users.

net.micro.atari is inappropriate partly for the same reason, and partly
because the ST is so different from the existing Atari machines.

WRONG! I'd rather not weed through the reams of patches to the MacFinder
just to find the Atari ST notes. GAK! Judging by the high volume of
traffic in the net.micro.atari, I expect keeping the ST stuff in there
is probably ok. If ST stuff gets really gigantic, THEN lets worry about
net.micro.jac.

I suggest that you should not throw caution to the wind and get on the "backlog bandwagon".

Every new model line has its problems in meeting production schedules and specs.Don't get caught forking up good money for an as yet untried and undelivered product. Why give your hard earned money to a mail order firm that can't give you a firm shipping date? Bank your money so you earn the interest instead of someone else.

Wait a little while, think about your purchase then wait one more week before you write out that check.

*** EVEN IF HE IS FROM COMMODORE HE'S OK BY ME ***

I spent last night at my local computer store playing with a brand
new 130xe(the compatible one). It ran the Flight Simulator,
Bounty Bob strikes Back, and the walking robot CES Demo with no
problems.

The dealer cost is around $127 so it should sell for around $170 or
less. The documentation is relatively complete, and well written with
a +++ for the fact that it has all the pinouts for the various ports,
etc. (even the cartridge slot).

According to an atari hardware buff, the extra 64k (this being a 128k
machine) is addressed the same way as either the Mosaic or Axalon card
is addressed (I can't remember which) so the Syn series should take advantage
of the extra memory.

Well, at least he got something out the door.

<bug line>

I think creatng a newsgroup for a machine that isn't even being sold yet
is premature; I would suggest waiting a month or two before creating the
group.

In the meantime, some discussion of the ST in this group is not likely to
be a problem for anyone.

It looks like quite a nice machine, though of course I'll reserve judgement
until I have a chance to play with one (probably next month).

 A week ago I submitted the folowing query. Although I got no response
 from the net through some leg work I was able to figure out the problem:

Problem:
I have an Atari 400 with 48K, a Trak AT-D2 disk drive with printer port and 4K buffer connected to an Epson MX-80 printer. The problem is when printing large files, large portions of the files are lost. It seems as if the 4K buffer in the Trak gets filled the Atari does not stop sending data to the Trak. Small files, < 4K, print with no problem. I believe I have all the DIP switches in the Epson and on the back of the Trak set properly. Has anyone had a problem like this? I am hoping it is a setup problem not a problem with the printer interface in the Trak.

Solution:
After asking a local dealer about the problem he informed me that Trak was shipping disk drives with one of the printer buffer memory chips missing. I opened the disk drive myself and after some poking around saw an empty 28 pin dip socket. There was another 28 pin DIP socket with a 24 pin DIP IC plugged in. Upon checking the numbers on the chip I found that it was a Misubishi 2Kx8 static NMOS RAM. I happened to have 2Kx8 CMOS static RAMs and I plugged one of those in the empty DIP socket in the same manner as the existing RAM. That is lining up pin one of the 24 pin RAM to pin 3 of the 28 pin DIP socket. The printer interface works beautifully now.

Further investigation of the data sheets of 2Kx8 static RAMs and and 8Kx8 static RAMs revealed that they are practically pin for pin compatible with the additional address lines placed at pins 1,2,27,28 of the 28 pin package. Therefore expanding the TRAK's printer buffer to 16K requires substitution of the 2Kx8 RAMs with 8Kx8 devices plus cutting a jumper wire to tell the controller how much RAM is in the buffer.
It's amazing that TRAK was selling known bad disk drives with only half of the printer buffer installed hoping that people wouldn't notice till the 90 day warranty was up. You wouldn't notice the problem unless you overflowed the 2K buffer in the disk drive printer interface. Now I know why TRAK went out of bussiness!

re: ST, XE, and rogue
     The 130 XE is out and available.
It looks nice, works fine, and has ramdisk software to use the
other 64k for convenience. The st is not out yet, but they do exist. I have
spoken to someone who has seen and touched it at a software developer's
place in the city. They paid $4800 for it. By the way, has anyone got
information about rogue for the atari? Did that fellow ever answer any queries
about his version.
     Thnx

I have the older Atari 800. I would like to use a green screen monitor
on the monitor port for text work and a small TV on the RF modulator
for games/graphics. At times both displays might be on together.

Will I have any loading or other problems in doing this?

Allen Leigh

> Someone here at work placed a small news item on the board
> which said that Atari had withdrawn from a June tradeshow, and
> strongly implied that the ST was endagered by money problems.

Can anyone confirm or deny this published rummor? I believe
it came from the Wall Street Journal.

HANDS-ON WITH ANTIC'S

DEVELOPMENT 520ST

by JACK POWELL ANTIC TECHNICAL EDITOR

Our Atari 520ST just arrived in the Antic offices. This is the $5,500 development package, and it includes the computer, two 3 1/2" disk drives, one medium-resolution (640 X 200) RGB analog monitor, and one mouse.

The software in the package is the "C" compiler, machine language assembler and debugger by Digital Research, the Mince screen editor by Mark of the Unicorn, Kermit -- a modem protocol program for file transfer, CP/M-68, and, of course, GEM -- which is in ROM in the machine.

On back order -- but expected soon -- is a high-resolution (640 X 400) monochrome monitor and a ten-megabyte hard disk.

Along with all this came 1000 pages of documentation and since it will take some time to digest all of this, we thought you might like a first impression of this new, high-level Atari computer.

The development 520ST is a preliminary model and there will be some changes between now and the time you see it in the stores, but all parts of this machine were factory made in the same manufacturing plants as the final product will be. The only real difference -- besides the price -- is that these machines were hand assembled.

The first thing you notice when taking the ST out of its box, is that it's very light. Although somewhat larger in size than the 800XL, it feels lighter. This may be because the shielding has not yet been added.

It looks exactly like the ST on our May cover, but there are some details you can't see from the photograph. On the right edge of the machine, to the rear, are two joystick ports identical in appearance to current Atari joystick ports, except they are also used for the mouse.

On the left edge, rear -- opposite the joystick ports, is the cartridge slot. This will accept a 40-pin board -- 20 upper and 20 lower.

In back of the computer are various switches and ports, each labelled beneath and with an indicating icon etched in the plastic above. From left to right they are:

Reset - a small, square button.
Power - identical to previous Atari power switches.
Power In - 7-pin, male DIN.
MIDI Out - 5-pin, female DIN.
MIDI In - same as above.
Television - RCA, female.
Channel - mini-switch, labelled "L" "H".
Monitor - 13-pin, female DIN.
Printer - female D-25, IBM-PC/Centronics compatible.
Modem - male D-25, IBM compatible.
Floppy Disk - 14-pin, female DIN.
Hard Disk - female D-19.

Besides the standard keyboard and ten-key pad, are ten function keys, labelled F1 to F10. The isolated cursor section is particularly well designed with the lower three keys representing Left, Down and Right, and the Up arrow centered above them. On either side of the Up key are Insert and Clr/Home. The top two keys in the cluster -- which are enlarged -- are Help and Undo. The Undo

key may become particularly useful.
   The drives accept Sony 3 1/2" disks. To boot the machine, first turn on the drives and insert both disks before turning on the computer. A disk must be in a drive for the computer to later access that drive.
   When booted, the GEM desktop appears as a light green background with pale blue border and black-outlined icons. In the upper right corner of the screen are two disk icons, one over the other, that look like file cabinet drawers. In the lower right corner of the screen is a trash can.
   In the border area, above the upper left section of the green background, are the words, "DESK FILE VIEW OPTIONS." In the middle of the screen is a thin, black arrow-cursor which is moved by the mouse.
   We'll save details on GEM for later articles. Suffice it to say, it is fast! It can redraw an entire screen of icons in the blink of an eye.
   This is just a surface description of an exciting new machine. Antic wants to get the information out to you as soon as possible and we plan to share our ST experiences as they happen. Stay tuned for further details.

Keywords: XE, Rogue, Ball Blaxzer, Fractels

-
XE's - I have seen a 130 XE at a local store, unfortunally it did not work.
       I was told that the price will be around $150. Not bad! I have also
       seen a 130 at a user's group meeting a couple of months ago. My only
       complaint about it so far, I've only had a few minutes to play with
       it, is the keyboard. It is not nearly as nice as my old 800's. It
       feels like the keys have been placed over an IBM PC Jr. keyboard.
       There is a definate rubbery or spongy feel to it.

Rogue - At the last user group meeting someone from EPYX showed up. He said
     Rogue will be available soon, a couple of months, for the Ataris.
     It is listed in their latest catalog.

Empire - EPYX is also working on Empire of the Ataris, the single player
      version of the game. Apparently they are still playing around
      with what 'options' to include. It sounds like it will be out
      by late summer or later.

Ball Blazer and Recue on Fractales - EPYX has picked up these two games
      written by Lucasfilms. Both are now available for Ataris and C64s.
      I bought a copy of Ball Blazer and will get Fractels as soon as
      I can. Go out and look at these games. They are some of the best
      I have seen in quite a while.

Summary:

Two different dealers in town (not exactly a large sample) have told
me that Atari will not be selling the 130ST, only the 520ST. (It makes
sense, why cripple your machine with 64K DRAMs when 256K DRAMs are
almost the same price?)

They expect to have demo models around May 20th. At first, they will
be selling a packaged system consisting of 520ST, medium res. colour
monitor, one 500K floppy and a mouse for $1300 CDN.

Using two simultaneous displays may load your video driver too much, and cause
circuitry to burn. It is therefore not a good idea to run two monitors
simultaneously, unless you can convince yourself that the maximum current
consumed by the monitors is less than the maximum current rating for video
output. The sum of the current maxima for each monitor should do nicely.

Note that we're not talking about information loss here, just potential
electrical difficulties/damage.

At the Hannover Fair here in Germany I have seen two 520 ST.
They were both running with 512kB, 1mB drives, monochrome
and color monitor. GEM was much faster than on PC-compatibles.
Release date: about end of July (not offical).

*** DON'T REPLACE THIS LINE WITH YOUR MESSAGE ***

There is no problem in loading down the Atari Computers Video
outputs by using 2 or even 3 monitors. Remeber the outputs
for Composite Video (Color), Composite Lum. (B/W) and TV are from
separate sources. Also I think each one of these outputs is robust enough
to handle a couple of monitors on each of them all at once for a
total of six displays at the same time.

May 1985 TOC ANTIC Magazine
Theme: The New Super Ataris

page article

13 COMMUNICATIONS: TSCOPE AUTODIALER
A short, automatic log-on program for TSCOPE, the popular public domain telecommunications program. It will run on any Atari computer with disk drive and TSCOPE compatible modem.

19 THE HITCHHIKER'S GUIDE TO THE GALAXY
A review of Infocom's latest game.

20 GEM OF ATARI
A discussion of the GEM operating environment.

24 PAPERCLIP
A review of Paperclip word processor from Batteries Included.

28 MEET THE 68000
A discussion of the microprocessor in the new Atari ST computers.

32 MANIPULATING STRINGS
Learn how to manipulate the Variable Name Table and Variable Value Table in your BASIC programs to add speed and variety.

35 LAZY LOADER
This utility presents you with a menu of your BASIC programs. One touch commands permit RUNing of SAVEd programs or ENTERing of LISTed programs.

38 MODE MIXER
This utility program can easily create custom display screens that use multiple graphics modes that can be saved for later use in your own program.

43 BEER PARTY ATARI
This useful applications program will keep track of the best brew in the beer tasting party. The programming makes good use of custom display lists and character sets. Can be used for any similar application.

45 SON OF INFOBITS
This enhancement of the remarkably simple and popular file program from the December, 1984 ANTIC provides an easy way to save, retrieve, edit and delete short notes and data.

49 GAME OF THE MONTH: ARENA RACER
This is a 15 scrolling level fiercely challenging maze action game.

52 THE TOOLBOX: HANDY USR ROUTINES
A collection of short but powerful USR machine language routines that can be usefully plugged into your BASIC program for any Atari Computer.

55 BONUS GAME: AMAZING
A challenging maze chase game that demonstrates the speed and versatility of the ACTION! language. Requires the ACTION! cartridge from OSS.

57 ASSEMBLY LANGUAGE: FADER II
This is an enhancement of the popular "FADER" program that appeared in the Sept. 1984 ANTIC. This program creates a dot-by-dot "lapse-dissolver" for Micro Painter or Micro Illustrator pictures.

59 SOFTWARE LIBRARY
The listing for all the programs in this issue.

81 PRODUCT REVIEWS
SOFTWARE:
Ghostbusters (Activision)
Spy Vs. Spy (First Star)
MAC/65 Toolkit (OSS, Inc)
U. S. Adventure (First Star)
50 Mission Crush (SSI)
Beyond Castle Wolfenstein (Muse Software)

Comments: The ANTIC software catalog has been expanded and I will soon post an updated version so anyone not getting the magazine can see what is new. Next month will be the Computer Arts Issue. I'll try to get it posted sooner.

not respond to me with comments for the original author. I am
trying to limit myself to forwarding only news messages of general
interest.

    Dan Fleysher

To: info-atari@su-score.ARPA
Subject: ANTIC & ANALOG
Date: 23 Apr 85 09:12:59 EST (Tue)
From: Walt Lazear <lazear@mitre.ARPA>

I have subscribed to both magazines for around two years.
ANALOG seemed to present better software (games and utilities)
with more sophisticated use of Atari's capabilities.
The last half year, though, I am having trouble telling them
apart. They both present the same utilities (cross reference
of BASIC programs, name table printers, etc.) and the
quality of the games is *way* down. I have even tried to
detect if the utilities were submitted by the same person
(or the same code). It seems clear to me that they both
use the same techniques in the programs, but they are not
direct copies.

My problem is that I feel perhaps the Atari 800 architecture
has been exploited as far as it can, and that the magazines
have naturally gravitated to the same path of offering
retread programs to their readers. Where I used to have

two sources of different information, I now have two sources
of the same information. I guess I am disappointed that
the newness of the architecture has worn off, and I feel
ripped off by not being offered anything distinct between
the two magazines. Yes, I have thought about cancelling
one of the subscriptions, but I keep hoping they will
diverge again.

I wonder if the software quality issue stems from people
turning to commercial sales of good software, instead of
publishing through the magazine? Perhaps Softside should
have served as a better example for magazines of this type?
By the way, has anybody ever heard from Softside again?
They gave great promises of a new approach about a year
ago, but have remained silent since then.

     I finally seen the ST's at the Trenton COmputer Festival last
Sunday. The 520 ST is really nice looking, has GEM and the mouse
completely operational, and seems to be more or less ready to go.
It can do very nice color, having seen some demos. Basic is intersting.
You can have a 'run' window, a 'list' window, and a debug window all at
the same time.   An atari dealer has told me that the 130ST is indeed
cancelled, and the 520 will at first be available only as a package with a
drive and monitor.
          Stay tuned,
          Mike

According to the April 22, 1985 issue of Electronic Engineering Times,
Atari was at the Hannover Fair but they did not show their new 32 bit
machine. They did demonstrate production readiness (whatever that means)
for the ST series of computers and announced that the 32 bit machine
would be based on the National 32000 family of microprocessors. According
to the article "Atari's choice of a 32000 family came after it realized
that the 32-bit Motorola 68020 processor would not be compatible with a
growing catalog of software developed for its 68000 based ST series."
There was no mention of when it would be released although if it is true
that they won't be at the summer CES, they may still be quite a ways
off.

Does anyone know the hardware specifics of the ST? How many slots, if
any does it have? What about monitor resolution in black and white, and
color? What size are the disk drives and are they single or double sided?
How about the size of this machine; is it small enough to be a portable like
a Mac?

Thanks Much,
Stuart

Stuart:
     There are lots of specs available on the ST in the last 2 or 3
issues of Antic and Analog magazine as well as most of the major
microcomputer magazines recently. However, the answers to those things
you wanted to know are: 320 x 200 & 640 x 200 in color. It is 16 colors
out of a pallette of 512, and I think there are ways of doing more than
16, just like display lists on the 800s & xls. The hi res monochrome
mode is 640 & 400, and requires a special monitor because of the vertical
resolution. It is very, very small and light, much more so than it looks
in the pictures. Therre arre no slots, but there is an expansion port
on the back.
          Mike Bassman

I would like to hear from anyone who has used

the ACTION! language. I am interested in purchasing
the cartridge, but I have both good and bad things
about it. I prefer to program in C or Pascal, so
I am not concerned too much with learning ACTION!, but
more with "what can I do in ACTION! easier or better
and what won't I like about it?".

Thanks for any help you can offer.

In case you missed it -- here's some rain on the Atari parade from the
Wall Street Journal of 18 April--

"Atari Pulls Put of June Trade Show,
Casting Doubt on New Home Computers

SUNNYVALE, Calif. - Atari Corp.
pulled out of a big consumer electronics
trade show, throwing into question its am-
bitious plans to deliver two new home com-
puters this year.

   At the same time Atari stepped up its
legal battle against its chief rival, Commo-
dore International Ltd., with new lawsuits
aimed at blocking Commodore from bring-
ing out a highly touted personal com-
puter.

   Atari's actions come amid several other
signs of trouble for Jack Tramiel in his

struggle to turn around Atari, a former loss-ridden unit of Warner Communications Inc. that he bought last summer. For example, early indications are that Atari is meeting some roadblocks in its critical effort to convince software companies to write programs for its new product line.

Though it is still a small, closely held company, Atari's fortunes are the subject of industrywide scrutiny, chiefly because of Mr. Tramiel's track record in building Commodore into a home computer giant. The plans of Mr. Tramiel and Commodore to breathe new life into the home-computer market by offering machines as powerful as Apple Computer Inc.'s Macintosh at low prices through mass-market retail channels could have an improtant impact on the industry.

Withdrawal from Show

A spokesman for the Consumer Electronics Show, the leading exposition for home computer and other electonic products, said Atari won't have an exhibit at the Chicago show, June 2 through June 5. The spokesman said Atari canceled it plan to have a booth at the show last week.

At the most recent Consumer Electronics Show in January in Las Vegas, Atari unveiled the first of its proposed new machines, a machine similar to the Macintosh and promised at about half the $2,195 price for a full Macintosh system. Atari officials have said the company would bring out another computer twice as powerful as the Macintosh at a West German trade fair this week and show it again at the Chicago show.

But Leonard Schreiber, Atari's general counsel, said the company was exhibiting the same computer in Germany this week that it introduced in January-the Atari ST. Mr. Schreiber said he didn't know why Atari backed out of the June consumer electronics show. Other Atari officials, including Mr. Tramiel, chairman, and his son Sam, Atari's president, were at the German exposition yesterdaty, Mr. Schreiber said.

Atari had promised to start selling the ST computer this month but it isn't available in stores yet.

Move Against Commodore

Meanwhile, Atari took two steps intended to derail Commodore's plans to bring out the personal computer it acquired when it bought Amiga Corp. last summer.

In a federal court suit in San Jose, Calif., Atari charged that the Amiga computer infringes on patents that belong to Atari, Mr. Schreiber said. The suit, which names both Amiga and Commodore as defendants, seeks unspecified injunctive relief and damages, Mr. Schreiber said. Mr. Schreiber said the suit concerns patents developed by a former Atari engineer who went on to become an Amiga Executive. The patents concern microchips that control the Amiga Computer's graphics, he said.

Last summer, before Amiga bcame a Commodore unit, Atari charged in a lawsuit that Amiga had broken a contraact to supply Atari three microchips-apparently the same parts at issue in the new patent action. The Amiga, which is expected to be unveiled later this spring reportedly resembles the Atari ST in low price and graphics dazzle.

Atari also last week petitioned the court to name Commodore as an additional defendant in its original breach-of-contract suit against Amiga, Mr Schreiber said. He said Commodore refused a previous request to be named as a defendant.

Joseph C. Benedetti, Commodore vice president and general counsel, said Atari''s legal moves were "purely for publicity purposes and harassment" and called them "an attempt to intimidate software developers involved with our Amiga project." He contended that Atari's Mr. Schreiber, Commodore's former general counsel, filed the new suit to persuade Commodore to drop its own previous lawsuit against Atari. That suit, still pending, charges that four engineers stole Commodore secrets before taking new jobs at Atari.

The latest moves mark an escalating feud between Mr. Tramiel's new company, Atari, and the company he founded 26 years ago. Last week, Commodore filed a lawsuit in Chicago against its ex-=vice president of sales, David Harris, who now is at Atari, charging he was "involved in subverting the room arrangements" of Commodore during the January electronics show, when space was scarce.

A more immediate problem for Atari is that software companies don't appear to be flocking to write programs for the ST. Some concerns report that Atari has been charging them four times the suggested retail price of a $1,000 ST system for prototype models to use for designing new programs. Computerf companies often bend over backwards to accommodate software developers, and many give them prototypes at a discount, if not for free.

Atari officials haven't responded to repeated requests to explain their unusual practice.

Some software companies say they won't invest any time or money into developing software for the ST until it's an established success.

Ventures Fall Through

Separately, reports were confirmed yesterday of two recent planned Atari ventures falling through. A spokesman for Mindset Corp., a small Sunnyvale microcomputer maker, said Atari discussed the possibility of buying the concern last winter but broke off talks at the end of the year.

Buying closely held Mindset would have been a transaction similar to Commodore's Amiga purchase, matching a newcomer's lively technology with a well-known company's established marketing channels. Mr. Schreiber said he didn't know anything about talks with Mindset.

In addition, Mr. Schreiber said Atari scrapped recent plants to occupy an Irish factory Warner had used to make Atari video-game machines. He said Atari's purchase accord with Warner gave Atari the option of using the factory, but the Irish government wasn't "sufficiently accommo-

dating."
   But an Irish government official based
in Silicon Valley, who conducted the gov-
ernment's negotiations with Atari, said Ire-
land gave Atari "an incredible package of
incentives," including investing in the
company and granting tax concessions.
The official said the plant shut down in De-
cember, idling about 400 workers."

Hello out there,
     I know this has been dealt with previously, but I have missed it before.
The problem is that I hav a copy of Atariwriter on disk, and the printer
drivers from Antic. I can't figure out what to do to get them to work together

     What do I need to do? I can do whatever is necessary...

Thanks in advance,

I just got my package of information on the Summer Consumer Electronics Show. Included was a list of exhibitors as of March 1, 1985. Atari

is NOT, repeat NOT, listed as an exhibitor. That doesn't mean that they won't be there but I would think that they could have decided by March 1 whether they are going to be there or not. I certainly hope so. They can only generate additional interest for the new line of computers if they are there to show them. Incidentally, Commodore will be an exhibitor. See you at the CES.

Since there is no net.src.atari, I am posting this little goodie right here. It's a small, but neat, sound program:

```
10 INPUT D
20 FOR X=0 to 3
30 SOUND X,PEEK(54283),14,6
40 FOR Y=1 TO D:NEXT Y
50 NEXT X
60 GOTO 20
```

You get some real neat stuff out of it! Enter inputs from 1 to 255; the lower numbers (1-10) are exspecially interesting.

Location 54283 is the vertical scan line counter, which changes extremely fast. This program reads it on regular intervals to create a 4-voice pattern.

If anyone else has some interesting little bitty tidbits, please post them!

Processor: 68000 at 8 MHz

ROM: 192 kByte (GEM and BASIC or LOGO)

RAM: 512 kByte

Slots: None!! But what do you need more. Interfaces included:

- RS232
- Centronics
- Floppy-IF
- Harddisk-IF (1.3 mBit/s)
- MIDI-IF
- 3 sound-generators
- Mouse-IF
- Joystick-IF
- Cartridge Slot

I think that is much more than you can add in an Apple II with its 8 slots.
Also you have more interfaces than on the Mac.

Resolution:

- 640 x 400 in monochrome
- 640 x 200 in 4 colors
- 320 x 200 in 16 colors (out of 512)

Floppies:

- SF314   1 mByte on 3.5" Disks (I think it must be DS/DD)
- SF354 0.5 mByte on 3.5" Disks.

Size: Very small. I think it's much more portable than the Mac. The whole hardware is locatet in the keyboard console, all connectors are on the back (RS232, Centronics, Floppy-IF, Harddisk-IF, etc.), on the left side (cartridge slot), or on the right side (Mouse, Game-Controllers).

Keyboard: Pretty Good. Typewriter-stile keyboard + cursor-block + numerical block + 10 function keys.

In Germany ATARI has the first ad in a computer magazine (Data Becker News). The 520 ST ist priced with 512kByte, Basic or Logo in ROM, one SF354 Floppy and GEM at DM 2795.-- (that are about $700 - $800 US$).

Availibility: ???

Uwe Hoch

Nf-From: unido!vr0z05   Apr 28 13:25:00 1985

Processor: 68000 at 8 MHz

ROM: 192 kByte (GEM and BASIC or LOGO)

RAM: 512 kByte

Slots: None!! But what do you need more. Interfaces included:

- RS232
- Centronics
- Floppy-IF
- Harddisk-IF (1.3 mBit/s)
- MIDI-IF
- 3 sound-generators
- Mouse-IF
- Joystick-IF
- Cartridge Slot

I think that is much more than you can add in an Apple II with its 8 slots.
Also you have more interfaces than on the Mac.

Resolution:

- 640 x 400 in monochrome
- 640 x 200 in 4 colors
- 320 x 200 in 16 colors (out of 512)

Floppies:

- SF314 1 mByte on 3.5" Disks (I think it must be DS/DD)
- SF354 0.5 mByte on 3.5" Disks.

Size: Very small. I think it's much more portable than the Mac. The
whole hardware is locatet in the keyboard console, all connectors
are on the back (RS232, Centronics, Floppy-IF, Harddisk-IF, etc.), on
the left side (cartridge slot), or on the right side (Mouse, Game-
Controllers).

Keyboard: Pretty Good. Typewriter-stile keyboard + cursor-block +
numerical block + 10 function keys.

In Germany ATARI has the first ad in a computer magazine (Data Becker News).
The 520 ST ist priced with 512kByte, Basic or Logo in ROM, one SF354
Floppy and GEM at DM 2795.-- (that are about $700 - $800 US$).

Availibility: ???

Uwe Hoch

June 1985 TOC ANTIC Magazine
Theme: Computer Arts

page article

8 COMMUNICATIONS: The #1 SYSOP
An article about the job Ron Luks is doing as the mail sysop on CompuServe's SIG*ATARI.

10 LOGO: TURTLE PIANO
A simple but adaptable logo program that plays a musical scale from the keyboard.

12 ANTIC AT THE FIRST GEM SEMINAR
ANTIC was the only magazine represented at the first GEM seminar sponsored by Digital Research.

14 PIXEL SCANNER
This BASIC program introduces you to pixel averaging--an advanced graphics technique similar to the method NASA uses for enhancing satellite photo details. Demo picture is included.

16 ATARI IN LIGHTS
A discussion of how Atari computers help James Brentano design and soon control the stage for the Drama Department At U.C. Berkeley.

21 COLOR PALETTE
Take the tedium out of program color selection with this joystick-driver BASIC utility.

22 COLOR THE COVER CONTEST
The winner and runners-up in the ANTIC sponsored contest. Several reader submitted pictures are shown. The winner is a scrolling picture and can be down loaded from SIG* ATARI on CompuServe. Great Demo!

25 PRINT SHOP
A Discussion of Broderbund's new program for the Atari.

29 COLOR INKLE LOOM
Design intricate 39-thread weaving patterns for the inkle

loom with this BASIC program. Of limited interest to most ATARI owners.

30 PLAY IT AGAIN, ATARI
A discussion of the musical ability of the ATARI and especially what it will be capable of soon with the MIDI interface.

35 GUITAR TUTOR
A program that diagrams and plays simulated guitar chords. BASIC.

37 THE MUSICIAN
A powerful and versatile "music construction" program. You can easily compose songs with three-part chord backgrounds- or simply copy the notes and chord symbols from sheet music. BASIC. 32K. Sounds like a good program with lots of options.

38 VIEW 3-D
Create 3-D wire-frame outline pictures in your Atari's highest resolution, Graphics 8 and Graphics 7+. Modify, shrink, rotate, and otherwise shift your view of the 3-D picture. Requires ACTION!, Disk Drive and 48K.

43 ASSEMBLY LANGUAGE: TURBO TYPO II
A modification to ANTIC's typing checker program to speed up the checking process.

45 G.U.P. THE GREAT
Speed up your BASIC graphics commands and add powerful new ones--including circles, squares and patterned fills. ATARI 400/800 owners can now access graphics commands available only on the XLs. Disk Drive and 48K.

48 GAME OF THE MONTH: HELICOPTER ROUND-UP
This BASIC action game challenges you to round 'em up from the air.

51 SOFTWARE LIBRARY
A listing of all the programs that go with the above articles.

77 PRODUCT REVIEWS
Hardware:
Colortone Keyboard (Waveform Corp.)

Comments: Koalapad has announced that they are discontinuing their Touch Tablet for the Atari. If you want one, now is the time to buy one before it is too late. Software Discounters of America is selling them for $29.95 (Software is on disk). After reading the Communications article on SIG*ATARI on CompuServe, I think you will be convinced that that is where you will want to subscribe if you have a modem. Does anyone know anything about Q-MODEM by

Quantum Microsystems, Inc.? They advertised as a 1200 baud modem in Analog Computing but ANTIC calls it a 300 baud modem in its New Products section. For $149.95 including software, it would be a good deal if it is 1200 baud. Now that Tim Eberling is no longer running his typing service, I am looking for a source of of the programs in the various magazines. I know I could subscribe on disk but that is megabucks if you want them all. Anyone know of another typing service? If anyone wants me to check out anything is particular at the Summer Consumer Electronic Show, let me know by June 1 so I can compile a list.

I having been having
many problems with Antic Publishing.
I have ordered several APX programs
and the Syncalc Tax templete on diskettes
from them - all have been defective.
It has taken months, yes months,
to get them replaced.
The major problem is that I ordered
Antic Magizine in November of 1984 and I
still have not received one issue on time.
After two phone calls two issues were sent a
month late.
Personally I find them incompetent.
Am I the only one having problems with Antic?

I also had the same problem, but someone cleared it up for me. Now I don't know whether this works on all Atariwriters or only modified ones, but name the printer driver PUTORUN.SYS and the proofreader (if you have it) DUTORUN.SYS and all should be well. If that doesn't work, switch the filenames around, but I am reasonably sure that 'D' is for the proofreader and 'P' for the printer driver.

The latest rumors are as follows. The 520 ST will be shipped within a week, but only to Canada...something about the FCC not finishing paperwork about RF interference and suchlike. Has anybody heard the

final word on whether it comes with basic or logo? The one I saw at the Trenton show was running both, but they were on disk, not in rom. Incidentally, the Basic seemed pretty neat, with a 'run' window with graphics, a list window and a debug window. But with all that going, it appeared rather slow.
Mike

I assume you mean you have the printer program that appeared in ANTIC several months ago. You may need to do some heavy modifying to get it to run exactly right for your set-up. A better way to go might be to buy the program PRINTER DRIVER CONSTRUCTION SET from ANTIC. It is an APX program (AP131) and costs $19.95. It will allow you to configure Atariwriter (c) for almost any type printer. The only problem is, you need the Atariwriter (c) cartridge. How did you get Atariwriter (c) on disk? Maybe I shouldn't question the obvious...

ANTIC Magazine Software Catalog V2.0

This is an updated list of the programs available from ANTIC Magazine as of June 1985. Additions are noted by a (*) in front of the number.

The following are programs that were formerly available from APX:

Cat #	Title	Price	Description
AP101	SPACE WAR	$15.95	A two player galactic shoot-out. ML.
AP102	CRIBBAGE	$12.95	One player game against the computer. An APX winner. BASIC with ML sub-routines.
AP103	LORD OF THE ORB	$15.95	New. Explore three vertically scrolling levels. ML.
AP104	SARATOGA	$15.95	An American Revolutionary War Simulation. APX winner. ML.
AP105	SNARK HUNT	$15.95	An underwater game. Up to 8 players can attempt the mission. An APX winner. BASIC with ML sub-routines.
AP106	STOCK MANAGEMENT	$19.95	An APX winner written in BASIC with ML sub-routines.
AP107	DIGGERBONK	$15.95	A one player vertical scrolling maze. ML.
AP108	DRAWIT	$19.95	An outstanding drawing program features 16 colors with 8 hues, automatic fill, 2 zoom levels, page wipes and an animator. ML.
AP109	BURGERS!	$15.95	Designed for young children. Has light and spritely music. ML.
AP110	GALAHAD AND THE HOLY GRAIL	$15.95	Graphics adventure. One of APX's all time best sellers. This and BURGERS! was written by Doug Crockford, one of

Lucasfilm's top game programmers. ML.

AP111 DOG DAZE DELUXE $15.95 One or two player game with 3-D effects are said to be excellent. ML.

AP112 BUMPOMOV'S DOGS $15.95 A two player game featuring splitting/ recombining screen. ML.

AP113 CHAMELEON CRT TERMINAL EMULATOR $19.95 VERSION 4.2. Convert your Atari into a computer terminal. For five types, "Glass TTY", ADM-3A, DEC VT-52, IBM 3031 ASCII and a Test terminal, CHAMELEON supports most-used features (including Kermit protocol). The wide-screen 80-column emulation (displays 40 columns at a time with auto horizontal scrolling). Use with UNIX operating systems. All terminal characteristics are user-definable. Supports the Atari 835 & 1035 modems and now has autodial capability (for 16 phone numbers). CHAMELEON is now totally compatible with AMODEM. ML.

AP114 DEEP BLUE C COMPILER $19.95 This is a proper subset of version 7 C, which means that programs written for it will run almost without change on computers supporting the full language. Written in C, requires a non-line oriented text editor.

AP115 DEEP BLUE SECRETS $19.95 Source code for AP114. Requires AP114, Atari Macro Assembler and a non-line oriented text editor.

AP116 DANDY $15.95 A 26 level dungeon adventure game that features cooperation. Up to four people can play at once with separate joy sticks. Good family game. ML.

AP117 INSTEDIT $19.95 A character set editor that helps you make maximum use of the advanced graphics capabilities of your Atari. BASIC with ML subroutines.

AP118 CUSTOM BLEND $19.95 It gives you the power to create any combination of text and graphics modes--even Display List Interrupts--automatically. ML.

*AP119 PHOBOS $15.95 A scrolling shoot-em-up game. Fans of Caverns of Mars will like this one.

An APX award winner. ML.

*AP120 MARS MISSION II $15.95 Sequel to Caverns of Mars. ML.

*AP121 RAID ON GRAVITRON $12.95 A scrolling 3-D point of view space game. ML.

*AP122 WEAKON $15.95 A classic arcade shoot-em-up with unique graphics and effects. ML.

*AP123 SEVEN CARD STUD $12.95 This is a construction type game. You set the personality traits (easy to bluff, etc). 100% joystick control. Realistic graphics & sound. BASIC, ML.

*AP124 CARTOONIST $19.95 A menu-driven animation program that gives you full control over movie characteristics. Full editing features and allows you to play back frames at any speed up to 200 frames/second. BASIC with ML subroutines. APX winner.

*AP125 REAL ESTATE CASH FLOW ANALYSIS $19.95 Analyze the costs and benefits of income producing property. A sample application is included. You also get free STRATEGIC FINANCIAL RATIO ANALYSIS. BASIC. APX winner.

*AP126 THE ROSTER $19.95 An easy-to-use system for managing lists of names and addresses. Stores up to 500 entries on a disk. BASIC with ML sub-routines.

*AP127 THE HOME INVENTORY $19.95 Catalog every item in your home for insurance purposes or your business for tax purposes. Track manufacturer, series number, purchase date and price, etc. BASIC with ML sub-routines.

*AP128 THE EXPENSE TRACKER $19.95 Use for home or business. Can keep track of expenses by type, employee, day, etc. Reports can be printed in detail or summary--by month or year-to-date. BASIC with ML sub-routines.

*AP129 DATA MANAGER XL $19.95 A general purpose data management program with internal mini word processor and mail merge option that works with WORD MAGIC (AP130). BASIC with ML sub-routines.

*AP130 WORD MAGIC $19.95 A word Processor that includes every major feature plus special ones such

			as super-fast cursor movement and on-line help files, cut and paste and trackball cursor control. Comes with GRAPHIC MAGIC, a program that allows you to incorporate graphics in your document and dump it to a Epson or Gemini printer. ML.
*AP131	PRINTER DRIVER CONSTRUCTION SET	$19.95	Designed for use with Atariwriter(c) cartridge from Atari. Will make it completely compatible with whatever printer you own and allow you to take full advantage of it's features. ML.
*AP132	MATHLIB FOR DEEP BLUE C	$19.95	A whole new library of math functions designed to expand your DEEP BLUE C COMPILER into the area of floating point calculations. Has 32 new math functions. ML. Requires DEEP BLUE C COMPILER (AP114).
*AP133	THE FAMILY TREE	$19.95	A genealogy program. This allows you to store up to about 24 generations on a disk. Screen shows a tree with names and choosing a name displays information and allows update. BASIC
*AP134	MAPWARE	$19.95	Create and save high-resolution world maps. BASIC.
*AP135	SCREEN PLOT	$12.95	A useful graphics program that allows you to transfer color screens created by almost any Atari graphics program to paper via the Atari 1020, Radio Shack CGP-115, Mannesmann Tally Pixy 3 or Sweet Pea color plotter. ML.
*AP136	THE HELP SYSTEM	$15.95	Create help systems for your programs. Includes HELP TEXT COMPILER and HELP TEXT VIEWER. Create any arrangement of menus and sub-menus with up to 25 levels of menus. (Shades of Compuserve). ML. Requires Text Editor such as WORD MAGIC (AP130).
*AP137	TAXICAB HILL	$15.95	Action game set in San Francisco. Features super-high-res 4-voice music mode never heard before in any Atari game. ML.

Note: ML means written in machine language. BASIC means it is written in BASIC and requires the BASIC cartridge (on the 400 & 800).

ANTIC also is selling the PAPIE Disks. These 8 disks contain subroutines and utilities from the best of the Atari programmers including Russ Wetmore (Preppie I & II), Clinton Parker (creator of ACTION! and fellow netter), Jim Nangano (Flip & Flop), Sheldon Leemon, Jerry White and many others. These are of interest only to advanced programmers probably, but you get full disks for $12.95 or all 8 for $79.95.

There is also a listing of all the public domain disks that have been available from ANTIC for some time now.

There is a shipping and handling charge of $3.00 for each disk order, provided the order is for 10 disks or less and $3.00 for each book ordered. These can be ordered toll free at 800-227-1617 ext. 133 or by mail from : ANTIC Publishing
524 Second St.
San Francisco, CA. 94107

I'll update this catalog as it changes and post it every few months.

> growing catalog of software developed for its 68000 based ST series."
>
>   Kit Kimes

Huh? The 68020 is *almost* object code compatible with the 68000! Unless
Atari did something silly like using the F-line instructions for system
calls they should have no problem going to the 68020.

I'll bet it has something to do with the high price (or current low
availability) of the 68020, although the 32000 family probably
isn't that much better.

I recently saw the ST, it really exists and works. There wasn't any
application software running at the demo however, just the desktop (apparently
the floppy was broken)...

Does anyone know anything (they are permitted to say) about the Commodore Amiga product? I read somewhere that Atari is suing Commodore for the Amiga VLSIs that Commodore acquired when it bought Amiga, but will this affect the release of the machine?

I have had no problems with getting my ANTIC magazine on time but I have not ordered any of the APX programs or any of their other programs for that matter. I personally find ANALOG COMPUTING magazine a little better in most respects but I subscribe to ANTIC because another Engineer here gets ANALOG COMPUTING and I get to read them both. I have found that several of the games in ANTIC are excellent and would like to get the programs on disk but I'm too cheap to subscribe to the disk service. Can you describe the problem you have had with the disks? Sometimes disks that come through the mail get flattened slightly and it is easy to run the edge of the disk along a hard surface. This frees up the floppy just enough to turn freely.

Having just babbled with somebody who claimed to have friends at Atari, I
now hear a rumor that Atari's absence from the summer CES is caused by two
things...one: they feel that the XE and ST series machines have been
sufficiently announced and two: having no other new products to show (I
wonder about this. Have all the new periphs been shown?) it would be
pointless to rehash the obvious. Anybody else heard this?

Also, a computer dealer he talked with (Atlanta, GA) claims ST's will be
shipped to the store THIS WEEK. Clearly, Atlanta is some distance from
Canada. Anybody else talked with their (surviving) Atari dealers?

What's going on? When can I lay my hands on one? Hmm hmm hmm?

waiting patiently,
-dave

You think you have problems!
    a couple of months ago i ordered antic through some toll free number
i got on a card in the mail. well after a couple of non toll free,
expensive calls to california, i still haven't got my magazine!
how's that for incompetence!

I have not ordered any merchandise from Antic, but I do have a subscription which has arrived every month. My only complaint is that my subscription does not always arrive before the newstands get theirs, which is somewhat annoying.

The explanation from the local dealer was that Atari was shipping the ST this week, but only in Canada, and he is not expecting them for another 4 weeks.

I recently purchase a used Atari that came with some software, but
no documentation. I am curious if anyone has a set of command summaries
for

    1) OS/A. I've figured out a few things: the largest of which is that
       even with my limited knowledge of this DOS, it is much more usable
       than ATARI DOS. The 'DIR' command alone improves things greatly.

    2) ASM/ED cartridge: I don't need pseudo-ops, just
       commands to give at the EDIT prompt: (I've figured out ASM and
       LIST) but that's about it. How do I execute assembled code?
       Trace? I think you'd get the idea.

Further, is anyone out there aware of any public-domain (hopefully macro)
assemblers?

I anxiously await having my mailbox stuffed with information. (Do use mail,
one posting on this subject is probably enough).

                        Eric Griswold

I think that this is something new! I got a sheet of paper at the
Hannover Fair with the specifications of computer and floppies.
In this paper were only mentioned the 520 ST CPU and the SF 314 and
SF 354 floppies.

The SF 314 is 3.5" and 1 Mbyte,
the SF 354 is 3.5" and 0.5 Mbyte.
Both are "compatible"(?!) to the 520 ST and have a seriell ATARI-Interface.
I don't know what "compatible" means in this case. The 250 Kbyte Floppy
was neither mentioned, nor shown. SF 354 and SF 314 were both working.

I've got my new Action cartridge on order and expect it any day now. I've heard that it's possible to create programs which run stand-alone, without the cartridge. Apparently you need a special disk of run-time routines. My dealer doesn't know anything about such a disk.

Does anyone out there know anything about this ?

The run-time disk is available only directly from OSS ($30 for the non-commercial license, if my memory serves me correctly. This allows you to make and distribute binary files only as free - i.e., to user groups, friends, etc.) You should also get the latest bug sheet from OSS. They don't seem to send it unless you ask, even if you've registered the

software.

The attached message was sent recently to ArpaNet's INFO-ATARI@Score.

I recently found out that there is an Atari version of RUNOFF. RUNOFF is a text formatter for large formal documents, producing table of contents, etc. It runs on DEC computers - those of you who have used it might want to check this out.

The Atari version is upward compatible. It includes selection of output format including numbered sections, bullets, alphabetic outline, and slides. Slides take advantage of Atari's color capabilities. The 100 page manual explains (among other things) how to make 35mm slides by photographing your screen.

For a while, OSS was promoting Atari RUNOFF as "The PRINT Tool", but dropped it in favor of some other product. The author is Marshall Abrams@mitre.arpa. If anyone wants more details, I can forward your request to him.

> affect the release of the machine?

The question is, is there such a thing as an Amiga?

The Amiga Lorraine which Commodore announced some time back has never
been shown in public. Given that a show-able prototype is usually
produced many months before production units hit the dealers' shelves,
it is a safe bet that the Commodore Lorraine will not be available this
year. I'm tempted to add, "if ever".

The lawsuit you mentioned stemmed from a contract between the old Amiga
company and the old Atari, which called for Atari to pay Amiga to
design some fancy VLSI sound and video chips. Just before Amiga sold
out to Commodore and Atari sold out to Tramel Technologies, Amiga
returned Atari's money in full with the explanation that Amiga had
failed in their attempts to produce viable designs. Tramel Technologies
claims that Amiga sold Atari's chips to Commodore. Amiga claims that
there *were* no chips.

Now, if there indeed were no chips, that would explain why the Lorraine
has never been shown in public. And why Commodore doesn't even talk
much about the Lorraine any more.

P.S.   It gives me a really warm feeling inside whenever I pause to
think about Jack Tramiel's name being misspelled in the company's name.

In Germany at the Hannover Fair J. Tramiel announced that ATARI
will do some seperate exihibition in parallel to the CES. Don't know
whether this is true or only a rumor.

I just got the May issue of Computer Entertainer, a newsletter the reviews software (mainly games) and hardware. They keep pretty close tabs on the happenings in the industry. Their feeling clearly parallels my own. No company can afford to miss the Summer CES if they want to sell big orders to retailers for the comming Christmas season. Although they didn't mention that ATARI would have a private showing at some hotel room, they did mention that this is getting more popular. For instance, the list of software manufacturers NOT at the summer CES is as long as those that will be there. CBS Software has just cancelled their booth and others are contemplating doing the same. They estimate is costs anywhere from $250,000 to $750,000 to have a booth at summer CES if you have a decent size booth, including transportation, staffing, set-up, hotels, etc.

The bottom line is money and ATARI can ill afford to throw away a half a million bucks. They just had another lay-off according to Computer Entertainer and reportedly employees are grumbling because the latest paycheck has a pay cut of anywhere from 5 to 20 %, without any fore-warning! ATARI has had trouble getting distributors to commit to big orders for the ST line and software vendors are not exactly jumping on the slow moving bandwagon. In fact, SIERRA is one of the only ones to be actively developing some software at the present time.

Ok, is it short enough for someone to post, or does anyone have the
address to send for a copy?

In addition, I have heard rumors of a public domain version of the
run-time package. Does anyone have a copy of it, and if so, can I
get a copy?

I think Jack Trameil (sp?) has been given a lot of undeserved
credit for the ST line. Considering the short time between his
purchase of Atari and the announcement of the ST line it's clear
that most of the developement occured before he got on the scene.

Whatever he has contributed has been on the business side. By
dumping the 800XLs at Xmas time he made a lot of us very happy
and raised some cash to make a go of the ST. But he has been
unsuccessful at generating much interest in any of the software
houses for developing stuff for the ST. If the ST has to wait
as long as the Macintosh did for software it won't be long
before the only Atari one can buy is a used one.

He may be making the most of a bad situation, but he hasn't won
the war yet.

Jim

*
There is an advertisement in the May '85 issue of Analog magazine
for something called a Q-Modem. According to their advertising,
this is something which stacks up pretty well, compared with other
modems currently available for the Atari. For US$150, you get a 300 Baud
modem, with "advanced" terminal software, modem handler, cables
and interface. It features tone dial, auto answer, audio monitor,
smart answer mode (?), and built-in help (presumably in the software).
For an extra US$79, there will be an upgrade available to 1200 baud
(I had to phone the company to find out about the extra cost).
The company is

Quantum Microsystems, Inc.
PO Box 179
Liverpool, NY
USA 13008
(315)-451-7747

Does anybody else know anything, good or bad, about this company,
their products, and/or this modem? I, for one, am amazed at the
possibility of getting a 1200 abud modem for only $230 (+canadian
exchange, +federal tax, +duty, +shipping cost; sigh).
Maybe I won't throw out my 800 right away, after all...

>   Mike B

    I think the package runs around $40.
    Since ACTION! searches compiled symbols before going
    through the library in ROM, the runtime files are simply
    included in the beginning of the program. Setting certain
    system variables allows you to designate the ORG of your
    program. Even offsets are possible. The package includes
    the full library as well as subsets.
    After compiling you simply write the file to disk from the
    monitor.

    With a clever relocation scheme one could compile the same program
    with a one page offset, create a bit map, and write a relocating
    loader... all in ACTION.

Is there a version of KERMIT for a Atari 800 (DOS 2.0)? This would presumably
be one somebody hacked up and has in self-contained, executable form.

Any pointers would be appreciated.

I saw the Atari 520 ST again, this time at the Toronto Computer Fair.
Atari was demonstrating two monochrome and two colour STs.

The ST will be available in Canada May 21. A system with 520ST,
monochrome monitor, 500K floppy and mouse will sell for $1400CDN;
with RGB colour monitor instead of monochrome, $1800CDN. ($1CDN ~~ $.7US)

Earlier specs indicated that the ST would come with GEM, etc, in 192K
of ROM. Now Atari says GEM, etc, will be loaded off disk. It looks like
they were afraid of doing ROM upgrades to hundreds of thousands of
machines. Unfortunately that means that a good chunk of RAM will be
consumed with GEM. It took 20 or 30 seconds to load the OS off disk when
powered on, but response seemed crisp after that (it should be if everying
is resident in RAM!). The salesman said that would be reduced to
almost no time when the hard disk becomes available (1.3 MByte/sec transfer
rate (DMA)). The hard disk is expected late in '85, 15 MBytes for $600.

The ST has floppy disk, DMA hard disk, parallel printer, serial, Midi in
and out, and video ports, as well as a ROM cartridge port (which only addresses
128K bytes). I don't believe there are any internal slots. I don't understand

why Atari put the Midi ports in...

Atari did a very nice job with the monochrome monitor. It is a high speed (35 MHz) white phosphor, to display 640 X 400 non-interlaced.

The GEM desktop really feels like a Mac clone. It has a menu bar (although Atari menus are "drop down", not "pull down" -- you don't have to press down on the mouse button to make the menu drop down, a feature I don't like!), desk accessories (a control panel and a Breakout game), dialog boxes, a trash can, windows with go-away-box, title, scroll bars, resize box, etc, etc.

I should say a "cheap" Mac clone. The environment didn't feel as polished as the Mac's. And there is some other operating system underneath, which I think is CPM-68K. I was able to break some program, and found myself with an "{A}" prompt. After some fiddling I got the world famous "Error on drive A. Abort, Retry, or Ignore" error, which you get from IBM PCs (probably all CPM or MS-DOS systems).

The software was sparse. There was some spreadsheet software which I think was their $90 1-2-3 Clone. I DIDN'T SEE Logo, Basic, GEM Draw, GEM Write, etc, which I was expecting. After all, this machine is going to be released in two weeks...

Looks like a good machine to hack on!

I just saw the 520ST and 130XE at Comdex in Atlanta. They had several ST's running GEM. Some with monochrome monitors and some

with color. They had one with an external 15meg disk (they say)
housed in a 1050 box. The hi-res monchrome monitor looked great
and the whole combination was operationally very much like a Mac.
The windows popped up quickly and moved around the screen with no
delay. It seemed very fast.

The announcement was that they were shipping. American dealers should
have ST's July 8th. The cost for a 512K ST, 360kb micro drive, and
high-res monitor was $799. They were quoting 25 discont point to
dealers. I figure this must make their cost about $350. Seems
hard to believe they really can produce the machine for that.
Still, if they do it the market should be thrown into a tizzy.
The machine looks much nicer in person than any pictures suggest
and it really looks like a serious machine.

They were saying that a $1200 developers packace was available
which included all of the above, a second drive, a c-compiler and
some other things I forget.

A steady stream of traffic went through their samll room. It is
hard to believe that many won't want ot market this machine if Atari
can convince them this is real.

Warning: this article is long because there is a lot of news to tell.

I was also at the Toronto Computer Fair and would like to add to Jan Gray's article on the ST. There is indeed an operating system underneath GEM. GEM (Graphics Environment Manager) is NOT an operating system at all. It is a graphical interface that can be adapted to virtually any operating system. GEM is also available for MSDOS systems including the IBM PC, and is a good step towards a universal interface that would allow casual users to treat an IBM like a Mac like an ST, etc., and that will make it easier to port applications to several machines. The ST operating system is called TOS (originally The Operating System but now generally referred to as Tramiel's Operating System). Presumably users who are impatient with GEM's flashy graphics could opt to bypass GEM altogether to access TOS more directly, using a (horrors!) IBM-like line oriented command interpreter. In this way the ST can appeal both to the Mac-types and the more conservative IBM-types.

In the following, all amounts are in Canadian funds ($1 CAN ~~ $.7 US).

According to the salesmen I talked to, the ST will be available in Canada on June 1 (not May 21 as originally announced). The $1400 package (with 520ST, 500K floppy, and 640 X 400 monochrome monitor) will be the only one available. The colour monitor will be available in July for $600. The salesmen speculated that an $1800 package including the colour monitor might be available, but implied that it would be left up to the dealers to decide.

The colour monitor is beautiful! There is a selection of 512 colours to choose from (eight levels each of red, green, and blue). In 'low' resolution mode (320 X 200), 16 of these colours can be used simultaneously on the screen. In 'medium' resolution (640 X 200), 4 colours can be used. The large selection of colours makes subtle shading possible, and the three dimensional pictures demoed seemed to leap off the screen. Granted, this is not exactly state of the art computer graphics, but for $600, it's an amazing monitor. The monitor also has a black and white mode that may be easier on the eyes for ordinary operating system operations. I doubt the extra vertical resolution on the monochrome monitor will make a whole lot of difference, so I'd advise waiting until the colour monitor is available.

500K floppy drives will be $260. Up to four can be added.

The hard disk was said to be 15 M for $700-$800. (Jan Gray said $600 - the price seems to be rising ...) One salemen said that it could be ready as soon as July, but don't count on it. The ST comes with a built-in 1.3 M/s hard disk controller. It also has an RS232C serial port and a Centronics parallel port, as well as a MIDI interface. Jan Gray remarked that he didn't "understand why Atari put the Midi ports in". MIDI is the new standard interface for music synthesis, and should be a boon for anyone who wants to mix flashy music with their flashy graphics.

Three printers will be available (possibly by July). These are all described in the April/May Atari Explorer. The SDM124 Daisy Wheel printer will be $399. The SMM804 Dot Matrix printer will have the same resolution as the

Apple Imagewriter (1280 dots across) and will be less than half the price, according to the Explorer, making it roughly the same price as the daisy wheel. Any image on an ST monitor can be dumped to the printer. The STC504 Color Thermal Transfer printer will print in 16 colours and any colour monitor image can be dumped to it (presumably, it won't be able to capture the image accurately, since the monitor can display 512 possible colours).

One salesman told me that Atari wanted the ST to be a completely open system and that Atari itself would be publishing complete development documentation including pin-out diagrams. Since the total preliminary development documents are rumored to have been about 4000 pages, it may take Atari some time to edit all this into a more concise publishable form.

Despite stories to the contrary, the ST is expandable. It has been designed so that the current RAM chips will be replaceable by 1 megabyte chips when they become available, enabling the ST to have up to 4 megabytes of RAM, enough to run even a large Smalltalk application.

Even more exciting is the fact that Atari is going to make a CD ROM interface available. When compact disks are used to store data instead of music, they can store 550 M (that's right, 550 megabytes !). The first ROM available is expected to be the entire World Book Encyclopedia !

Despite all this exciting news, there is no doubt that software is (at least for a while) going to be a problem. The first salesman I talked to claimed that no software was being demonstrated because Atari didn't want people stealing its ideas before the product release. As the product release is less than three weeks away, that was obviously nonsense. Another salesman later drew a small crowd by clearly and fairly answering questions about the machine. He admitted that NO software except possibly Basic and Logo will be available by June 1. He said, however, that 300 developers including Microsoft, Lotus, and Ashton-Tate had paid about $4500 for hand-built ST's and development software and documentation, and some seemed to be planning to release software in July to coincide with the US ST release. The Digital Research C Compiler is expected "real soon" for under $100. At least one company has announced products: Haba Systems, who developed the Quartet integrated system for the Mac, have announced HabaWorks (Word, File, Calc, Graph, and Com) for $59.95 US (each?) and the Hippo C Compiler, also for $59.95 US. These are supposed to be available in July. The $90 Infinity integrated package expected with the machine's release has been delayed. The 'spreadsheet' that Jan Gray saw was likely the nonworking mockup that I saw demonstrated.

Finally, a small flame about the word 'clone'. Jan Gray called Infinity a "1-2-3 Clone". Infinity will include word processing and communication capabilities not available with 1-2-3. It is an integrated package, yes, but if we call it a "1-2-3 Clone", we will have to call Framework, Symphony, Jazz, and all the other integrated packages, 1-2-3 clones as well, and that is not really fair. Moreover, it is even unfair to accuse Atari of producing a "Mac clone". The hardware Atari has developed is far different. The monitors are larger (12 inches rather than 9 inches), provide greater resolution, one provides colour, and they are separated from the computer.

The ST circuitry is amazingly simple (one small board hidden in the keyboard). The mouse has two buttons rather than one. The keyboard itself has a different layout. A hard disk controller and MIDI interface are provided. There are many more hardware differences. About the only significant hardware similarity is that both machines use the 68000. Would anyone accuse Apple of producing a Sage clone? Atari is not guilty of the kind of coat-tail hanging common in the IBM-compatible market. Mac programs will not run on the ST. The machine must be judged on its own merits.

There is no doubt that Digital Research has designed GEM to imitate the Macintosh Finder, but even here there are differences. GEM was not designed to "replace an operating system", but to serve as an interface for several operating systems. Apple fans who accuse Digital Research of theft are being a mite self righteous. The user interface of the Lisa and the Mac is NOT innovative, but is borrowed from that Computer Science paradise, the Xerox Palo Alto Research Center. The Lisa was a Xerox Star imitation, with some improvements. Apple's innovations in the Mac were to drastically reduce the price one had to pay to use Star-like software (the Lisa was originally $15,000, and the Star was even more). Atari is simply continuing that process.

Alan Kay's dream of the Dynabook, a sophisticated information processor as easy to use as a book, and accessible to everyone, is close to being realized. Even Atari's drastic price reductions have not yet made the Xerox ideas affordable to "the rest of us", but any year now ...

So now, Commodore, what aces are YOU holding?

Kevin

> rate (DMA)). The hard disk is expected late in '85, 15 MBytes for $600.

Don't count on much improved performance with the hard disk. Some
hard disks use voice coils for quick head positioning and some use
stepper-moters to keep the cost low, but the Atari hard disk (when it
becomes available) is supposed to use a third technology which is
cheaper and slower still. Seek times are said to be roughly the same
as for floppies.

I'm thinking about turning in the 'ole 400 and its Inhome keyboard
for a shiny, new and compatible?? Atari 130XE computer. I have
some questions:

1. Does the 130XE OS have the same problems with some third party
    software that the 800XL has? Is the translation disk still necessary?
    Are there programs that won't even work with the translation
    disk?

2. Is the built in Basic the same as the 800XL's? How does 130XE's

Basic compare with the 400/800 cartridge Basic? Is it upward compatible?

3. Does anyone have any comments on the rear mounted cartridge slot (ease/pain of use, etc.)?

4. Are there any other significant hardware/software differences/ incompatiblities between the 130XE and the old 400/800 systems?

5. Is the keyboard on the 130XE better/worse that the 800XL?

6. Does Atariwriter know about the extra RAM in the 130XE? How about ACTION! or other popular non-game software?

Thanks in advance!

Antic has a good review of Print Shop from Broderbund. A friend has the Commodore version and speaks highly. I just called Broderbund to check that it supports my Okidata Microline 92 printer. Answer = no problem.

Here I must say full marks to this company. The woman in tech support asked me what printer interface I had. Answer = ATR8000. PROBLEM!

She said they had not tested with the ATR, but had heard Print Shop
would not run through it.

Does anyone know about this? Can anyone recommend another similar
package?

This is the second time I have hit compatibility trouble with the ATR.
It would not load a heavily protected disk (Ultima) which needs a real
Atari drive. Otherwise, I have to add, the ATR 8000 does excellent work.

Subject: Re: chameleon

1) It is in the format of an autorun.sys file. You do not need any cartridges.
2) On the 800 you have to do <esc> <atari logo> sequence or something like
    that. On IBM machines, though you might want to consider doing <CTRL> D.
3) Yes, it does display on the screen what you type.
4) You can even put your mode in answer mode. The rest of standard
   characteristic modifications are available as well.
5) The upload/download might take a little playing around, though. For an IBM
  machine you might need to set the file characteristics in a specific way
  (like binary/text fil, etc....)

Here are some price comparisons (in Canadian dollars, $1 CDN ~ $.7 US,
officially, but in the computer market, it seems more like $1 CDN ~ $.6 US)
The Apple prices are from the Apple Canada Suggested Retail Price List.

Item	Atari ST	Apple Macintosh
512K 68000 computer with 1 360K (500K unformatted) 3 1/2" floppy drive and a monochrome monitor	$1400	$4095
High density dot matrix printer (1280 dots per line)	~$300-$400	$950
Daisy wheel printer	$399	$3280
Floppy Disk Drive	$260	$775
Hard Disk	~$700-$800 (15M)	$3125 (10M)

The monochrome monitor has a higher resolution (640 X 400) than the Mac's,
and a colour monitor (that can show 512 colours) is also available for
$600. I'll grant you that dealers may substantially discount their Mac's,
but not by THAT much. Of course Mac owners pay for QUALITY, right? [:-)]

for official rumors about the ST, ANTIC mag has reports from Comdex on
Compuserve. If someone wants to D/L it , that would be nice, but its
already floating around various BBSs. It doesn't really say anything
we didn't know already except for a little bad news; that GEM may not
come in ROM after all. This would be real bad, becuase of the supposed
cap of 512K on memory, and GEM is a real memory hog, having been compiled.
Stay tuned.

you say the ST will be expandable beyond 512k. We have heard no such
thing anywhere. But if it were true, the expanded total would not
be 4 megabutes, as you figure. If the ST is using 64k chips, they have
8 banks of chips. If it uses 256k chips, it has 2 banks. SO if and when
1 mb chips show, and they are compatible, they would expand the ST to
8 mb (in the 64k case) or 2 mb (in the 256k case).

This week's (13 May) EE Times had a cover item on the ST's at Comdex.
Major items:

1) The 130ST is no more. The 'bundled' 520ST with hi-res (35MHz) B&W
   monitor and 0.5MB microfloppy will list for $799.

2) Mention is made in the article of OEM versions of the ST to come
   with 1 to 4Mb RAM.

3) Initial winchesters will be third-party, with an Atari-label 15Mb
   drive to be offered for $399. shortly thereafter.

4) Tramiel said the company would demo a $499. CD-ROM next month,
   using components from N V Philips, with shipment in August.
   This is also when volume shipments of the ST are expected to
   start.

5) Atari expects to show their NS32000-based system towards the end
   of this year.

I saw the 130XE available last night at my local Crazy Eddie (East
  Brunswick NJ). Maybe Jack will pull it off, after all.

You are correct in assuming that Mr. Trameil has been given a lot of undeserved
credit for the ST; but you are incorrect in assuming that the product was
underway before he arrived. The people who deserve the credit are the Atari
engineers who slaved away at the product to produce samples in the short time
span given.

Please keep me informed of any new information on Print Shop compatibility
with the ATR8000. I've heard lots of good thing about Print Shop, and
have been thinking of getting it. If it dosen't work on the ATR8000
though, It's of no use, as I'm not going to buy another printer interface.

Sorry to be contradictory, but a good friend who recently came back from
Japan has told me that; 1. He has played around with the Amiga and it is
really swift and COLORful, 2. It is in production via Sanyo, 3. Look for
it this summer. The guy is straight and a good friend. No corporate
ax to grind (guess his employer). I am interested to see what these
"Johnny come lately's" can produce. It might even be better than the
Macintosh (guess what I'm typing on) but then given enough time...

All I know is, its been heaven so far (and it ain't over yet).

Now if I only had an 8510/a to read all those old 8" floppys on my shelf :-).

As there are 16 chips with 256 Kbyte each, you can in case 1Mbyte chips
will be availible, expand the 520 ST to 2 Mbyte. This is also what we heard
here in Germany during and after the Hannover Trade Show.

What the hell will Atari do with spare ROM-place?. They have 6
places for roms (256kbit?) as we can see here on photos of the 520 ST
in some computer magazines. Will Atari put BASIC or some other silly
thing in it? I don't hope so. And for GEM experts: Isn't it possible
to put the VDI of GEM into ROM?

net.micro.atari:742

Several people have asked why Atari included the MIDI serial

ports on the soon-to-be introduced Atari ST. They asked "What for?"
I say: "Why not?"

The ST has two MIDI ports on the back, as defined in the MIDI standards, to allow daisy-chaining of devices on the MIDI bus, a ~31K baud serial link.

Although MIDI originated as a standard for communicating between the latest breed of synthesizers and electronic instruments, it has potential to become a low-speed local area network. All it takes is a pair of DIN cords to connect two Ataris. Does that give anyone any ideas?

The inclusion of MIDI opens up a whole new market for Atari. Coupled with the music capabilities built-in the ST, it will soon gain a reputation as a music machine.

(Readers of net.music.synth, close your eyes for this paragraph.) MIDI provides a digital link between most new synthesizers, rhythm boxes, sequencers, and even guitars. MIDI can transmit nearly all the information a device can supply - for instance, the bus can relay the details of playing a piece on a synthesizer - note values, length, even the rate at which you hit the key, giving amplitude data - and send them to any other device on the MIDI bus.

Also, MIDI devices can often map themselves onto another instrument. For example, you can map your drum machine onto the lower section of the keyboard of your synthesizer. Pressing those keys give drum sounds now. (Net.music.synth, open your eyes now.)

MIDI will open up new areas in computer music for many people, especially with cheaper interfaces like the Atari ST. No more will computer music programs ask you to play the QWERTYUIOP scale to get musical notes... Rather, imagine the strengths of music editors that edit musical data in this form, and can play the results instantly. It's not to hard to create a N-track recording studio, since MIDI can handle 16 devices at once, in most configurations.

There are a few drawbacks in the Atari MIDI setup. The driver for the port is not "smart," that is, the 68000 inside will have to do more work to drive the port than comparable MIDI interfaces for other computers. MIDI interfaces for other machines, for example, the IBM PC, are separate cards in the ~$100-200 range, and carry their own smarts, like the Roland MPU 401.

I work for Sight and Sound, Inc. We design software for MIDI using the Roland MPU 401 interface. There are several other companies in the USA that do this kind of software, but so far, the market has been limited to professional musicians.

The latest edition of the CompuClub News just arrived and it had a lot of interesting news in it. One thing that it included was a short article on the West Coast Computer Fair. I don't know exactly when it was held but I thought that you might be interested in the general comments they had on the Atari booth. It follows:

> "The ATARI booth (actually manned by people from a local user group) was far and away the hit of the show. While the giants like IBM showed products to one or two people at a time, the people at the ATARI booth were piled at least six deep throughout the show. In fact, the steadiest visitors were the three lonely reps from the Commodore booth."

They also said that the Atari portable (XEP) and the ST130 have been canceled for the short term future.

The newsletter was put together using Letter Perfect and the Print Shop. They have been using Letter Perfect for some time but this is the first issue using Print Shop and what a difference! They even have some graphics that look very nice.

Has anyone bought Bounty Bob Strikes Back yet? The latest edition of
the CompuClub News has some hints and some secrets you might want to
try. They are longer that I care to type in unless their is a lot of
interest. Incidentally, CompuClub is featuring a Bounty Bob special.
You get both "Miner 2049er" and "Bounty Bob Strikes Back" for the
special price of $33.70.

According to the CompuClub newsletter, MMP should start shipping their
1200-baud [actually 1200 bps] modem by mid-summer. It will list for
$199. The Plato (now called The Learning Phone) cartridge should be
available by now. It was supposed to ship by May 15. What a great

combination this would be. CompuClub now have their own bulletin board that costs nothing but the phone call and supports both 300 and 1200 modems. You don't have to be a member to use it. They have about one meg of download files and will put news flashes on-line on a regular basis.

From the May 13, 1985 issue of Electronic Engineering Times:

To critics who maintain that there is no "true" home-computer market, Tramiel responded that "maybe there is none, but still, it's undeniable that personal computers are going into the home."

Tramiel's strategy to penetrate the home appears to be based on positioning his machines as high-quality or futuristic educational tools. He Claims that the same sort of educational investments that parents make in getting violin lessons, or specialized education for their children, apply to personal computers as well.
...

Tramiel said the company would demonstrate a $499 CD-ROM optical

disk drive for the system next month, using some components supplied
by N.V. Philips of the Netherlands. Atari will manufacture the drive
with shipments in August. "We will help the industry deliver a complete
CD-ROM encyclopedia that takes up a fraction of the size of the equivalent
number of books," said Tramiel. "We will off the dictionaries of the
world, in all major languages."

I don't know about your Oki....but don't worry about the ATR8000!
Print shop works just fine with it and my Epson.

The only difference between it and the 850 is you configure the
print shop differently the first time you use it (you know...the
old extra line feed problem!) Luckily, the author thought to
include that feature in the software. After that (since it writes
the configuration back on the disk) you just use it.

Summary: A cheaper harddisk

The nicest quality I have noticed about the Atari ST is that
it has a cheap mass storage. A 15MB hard disk on the Atari
will reportedly sell for $400.

Any reports on a cheap hard disk for the Mac?

Cris

ps. Even though the Atari looks good, there is *NO* software!

Is anyone planning on porting os9/68k to the new atari ST series?

This combination has potential -- especially if a system with hard
disk, at least 1/2 mb ram, os9 and C can be obtained for under $2000.

Os9 is a multi-tasking, multi-user operating system. It is simular to
unix in many ways (pipes, the shell is just a program, etc.) but is
tailored to small systems. (And the commands have reasonable names.)

The Print Shop works fine with an ATR8000. By the way, it is a GREAT
program; my kids have used it more than any game we have.

According to the Electronic Engineering Times of May 20, 1985, Atari is going to use VIP Professional as its main spreadsheet for the new Atari's. I quote parts of the article:

> "VIP Technologies...will be one of the spearheads in Jack Tramiel's attempt to fulfill his promise to provide inexpensive computing power. VIP is to provide a less-than-$100 1-2-3 'clone' for Atari Corp. systems.
>
> Atari has licensed the company's product, VIP Professional, as the main standalone spreadsheet for the new Atari ST and XE computers.
>
> ...VIP Technologies is so excited by the Atari machines that it is delaying shipment of the newly released 1-2-3 clone for the Apple IIc and IIe. A 'substantial' long-term contract made it worthwhile, Nelson (of VIP) said.
>
> VIP Professional can import 1-2-3 files and uses many templates and books written supporting 1-2-3. The company will be providing other vertical market applications for Atari to run on the VIP Professional 'base' product."

It looks like this product can be called a true 1-2-3 clone. My only question is 'What happened to Infinity?'. I would like to get it since it sounds like an excellent integrated package. I would ask Matrix Software at the Summer CES, but they arn't listed among the exhibitors. Anyone know anything about Infinity? Will it be available from the company or through software dealers?

I am interested in getting lots of opinions on
the best way to go about getting/building a
system that I can develop some real-time graphics
games on that two or more people can play.
My neighbor is telling me that the AT800 is
great but...(I use 68xxx and 32xxx and etc and
the AT800 seems like such a "toy"). Just what

is available out there now and how much will it cost
me. I am an experienced s/w type and a novice h/w type
(but willing to blow up some boards trying!).

These games are just for my own personal use
"veg-ing out" after a hard days work, not for
sale..

Please mail hints and other tidbits to me.

[.,.....[

I heard another rumor the other day that indicated that the reason that
ST's are availiable in Canada before the US is because of FCC approval
delays. In addition, I heard that Germany is experiencing a similar
delay for similar reasons.

*** REPLACE THIS LINE WITH A THING YOUR AUNT GAVE YOU... ***

I'd like to solicit any recommendations, good or bad, that anybody has regarding software-by-mail companies. Include information about timeliness, relative pricing, complaints, methods of payment, etc. Please mail to me directly; if there seems to be sufficient interest, I'll post a summary. I'm personally only interested in companies that carry Atari software, but for future reference, I'll accept companies that carry hardware, or software for other machines, also. (My motivation for this posting is that I can't seem to find any local stores that carry Atari software, and the ones that do are severely lacking (e.g. Toys R Us is the best one, and it has *NO* Infocom software!!!). Thanks,
--

[... but I don't want to buy a 1050.]

The Atari store here in Kitchener-Waterloo recently received
Epyx's "Rescue from Fractalus" by Lucasfilm Games.
Unfortunately, it appears to load correctly only on Atari-brand
disk drives. When I attempted to load it on my Indus or
the Trak's in the store, after going past sector 07 for the
second time, a multicolored screen appeared with LOAD ERROR
in large letters.

Does any one have any suggestions?

I did not have any such problems with "Ballblazer" and
"Fractalus" worked on the 130XE with the 1050 drive so
I'm pretty sure it is not a computer compatibility problem.
It did not work with with my Indus and 800XL with
basic in/out and/or translator loaded/not loaded
or the store's Trak's and old 800's (we tried 4 disks that
came in two different shipments to the store).

It was suggested to me that they placed extra protection
because of the large number of pirated copies but I find
it a bit unreasonable to make "Fractalus" work only on
Atari-brand drives (checks disk speed???).

If anyone could make a LOCAL call to Epyx (Lucasfilm??) to
check whether this LOAD ERROR was intended (maybe the
distributer up here just got a bad batch)
or if anyone knows of a disk-drive translator that makes
an Indus behave like a 1050 (make it munch disks :-),
I would greatly appreciate it.

Someone mentioned that they had a copy that did work on their drive
but that they also got it before Epyx released it. I do NOT want
to get my copy like this since I feel "Ballblazer" (and possibly
"Fractalus", I didn't get accustomed to playing it in the store)
is one of the best games for the Atari and I want to
make sure that Epyx/Lucasfilm are encouraged to produce similar
high quality games.

BTW, Is Lucasfilm going to produce more Atari games for the XL/XE/ST
or was the agreement with Atari terminated instead of transferred to Epyx??

   Thanks,
      Dani A. Roloson

I recently bought a second hand ATR8000. It is living up to expectations; but
I want more!! How can I write my own RS-232 I/O routines, my own disk
utilities, my own printer spoolers, my own ATARI terminal emulators when I
don't know the necessary I/O addresses or the ATARI to ATR8000 protocol??
How does the ATARI tell the ATR8000 to boot the CPM disk?

Does anyone have any insight into these problems they could share with me?
Is there a technical information manual that I should buy? Is there a
schematic, or other related technical information, available from SWP?

Thanks.

Your problem may very well be the disk drive speed. A review of the
Astra 1620 disk drive in the June 1985 issue of ANALOG COMPUTING
mentioned that they couldn't load BLUE MAX at first and the problem
turned out to be the speed. Use a good disk drive speed check program
to see what you are set at. It should be 290 RPM. The Astra was set
at 300 and was causing problems, so it is fairly critical.

Hope this helps...

>$2795 when I purchased it...I bought it through a university, and left off the
>external drive, and paid $2262. So where did you get your prices??? And
>don't claim that mine was bought a while ago, either--it arrived day before
>yesterday!!
>
>Roy

As I stated in the article, the prices are in the official Apple Canada
retail price list and are in CANADIAN funds. My point was that Apple
is charging far more than Atari for a machine that is NOT three times better
technically (although right now has far more software available).
I'll grant you that some universities are offering special deals on their
Macs, but these are not available for most of the "rest of us".
I am an Apple fan. It took courage and some innovation to bring the
Xerox Star microcomputer's ideas to an (almost) mass market computer,

but I think that is time that Apple stopped asking its dealers to charge what the market will bear, and starts charging something closer to what it actually costs to produce the machine. The official cost for the 512K upgrade is another example of this practice. (Remember, the first ball point pens were $25, and this time, that's in AMERICAN funds before the days of stagflation.)

Right now, there is no way I can afford a Mac at the prices Apple is charging. I may soon be able to buy an ST.

Kevin

Can you buy the Atari today? If so, from whom? I.e., is it vaporware or a product?

I am in need of a terminal program for the mpp 1000c modem that will enable me to use BAUDOT (ie 45.5 baud, 5-bit). I have the software patch that will let me use normal terminal packages as long as i use 300 baud. variable baud rate was not written into the
patch (nor the ability to xio to 5-bit
characters for that matter) since i do not know assembly, i am not even going to attempt to modify it. if you know of any such software, please help.

p.s. looking for spare parts? i found a mail order place that sells only replacement parts for the atari 400 through 1200xl to 800xl. they even have peripheral parts. their prices also seem reasonable (especially since you can not get some of these parts anywhere else.) the name & number is
AMERICAN TV

Keywords: vt100 action

I am attempting to program an improved vt100 emulator in Action! for
the Atari. This program would improve on the vt10sq public domain
program in various ways:
source code will be put in public domain
improved, modifiable character set
no mysterious system hangups

i was well on my way to implementing the 80 column screen routines
when one of my 'improvements' to the program did something to the
program. i have gone through it many times and even rewritten the
kernal, but still this bug remains. the problem is not in the
display, but which character gets displayed.
a to z and A to Z get shifted to !.. etc. i know what the bug does
but can't find the source
any help in this matter would be appreciated. also any help at all
in the programming itself would be appreciated.

i can be reached at:
sdcc6!88362744
sdcc13!ee65sct

until 6/13

thank you very much
Scott Weisman

I need to find out how to directly control an MMP 1000C modem. I have asked Micro Peripheral Products directly, but got no reply. Does anyone out there have information on this?

My thanks to those who replied with positive recommendations re. using the Print Shop package with the ATR8000. I called Broderbund again and they still believed it would not work, however I was assured that if I bought it direct from them they would refund on failure. (Incidentally I have so far always had good experiences with ordering software by mail.) Anyway I did order it, the Print Shop arrived in four days, works fine with the ATR8000 and does good stuff.

Once again I feel bound to ackowledge the Broderbund technical support people for their uncomon honesty, if not their accuracy.

July 1985 ANTIC Table of Contents

Page Article

10 ANTIC ANNIVERSARY ALBUM
Pictures of some of the attendees at the party for ANTIC's third year of publishing. Several Atari officials attended including Sam Tramiel.

13 EDUCATION: DUCKS, SEAHORSES AND MUPPETS
A look at some of the new educational software available for the Atari.

16 EIGHT NEW SYNAPSE GAMES
A review of eight of the latest games from Synapse as well as information of the merger of Synapse and Broderbund.

18 130XE: HOW ATARI'S NEW 8-BIT DOES IT
A look at some of the technical information having to do with the 130XE including a look at bank switching.

21 CRYPTOQUOTES
A program to use on the Atari to help you solve cryptograms. An automatic 'blackboard' for codebreaking.

23 BONUS GAME: STAR VENTURE
A space type dodge-em game written by Ron Saari who runs an Atari bulletin board in NJ. Phone (201)-449-3895

24 GUESS THAT SONG
A musical show emceed by your Atari. How many notes do you bid to Guess That Song? You can add more songs but it is not a construction type program and not easy to add.

28 WAR GAMES, THE STORY OF S.S.I.
An interview with Joey Billings, president of S.S.I. Good article for anyone who likes war simulation type games.

31 BONUS GAME: DARK STAR
A space shoot-em-up with some different twists. A first for ANTIC: Both a BASIC and an ACTION! listing of the program is included.

33 SLIDE
A Computerized version of the 24-tile puzzle grid.

35 COMPUTER CHESS PROGRAMMING
A look at the progress that is being made in the programs for computerized Chess and a look at Odesta Chess from Odesta Corp.

39 OVER FLOW
Now you can be the Sanitary Engineer (plumber) you always wanted to be! Keep the pots from overflowing in this scrolling game.

40 EVERYTHING YOU WANTED TO KNOW ABOUT EVERY D.O.S.
A review of seven different DOS's including Atari 2.5. TOPDOS 1.4 came out looking the best.

48 GAME OF THE MONTH: MINIATURE GOLF
This game is an 8 hole miniature golf game that contains two listings. One is the game itself and the second is a construction set listing so you can add holes of your own design. It makes it quite easy to do and also to add them to the original 8 or replace any of the original 8.

74 PRODUCT REVIEWS
Software: COMPUTER AMBUSH (S.S.I)
GULF STRIKE (Avalon Hill)
TRIVIA FEVER (Professional Software, Inc)
Cassette Adventures (Level 9 Computing) A review of 8 cassette based adventures from England that look quite good. Some are based on "The Lord of the Rings" by J.R.R. Tolkien.
Hardware: STAR SG-10 PRINTER (Star Micronics)
MICROSTUFFER PRINTER INTERFACE (M.P.P.)

Comments: Both ANTIC and Analog Computing are smaller than they have been previously but it is quite a good issue. There is an ad by OSS touting their new BASIC XE made especially for the 130XE. There is a response from Spinnaker as to why they might not translate some of their text adventures for the Atari. Once again ANTIC will be having daily bulletins from the Summer CES. If someone can again download them, I'm sure we would all appreciate it. By next show, I'll have the capability. According to an ad by Computer Direct, The Learning Phone cartridge (formally PLATO) is now available for $19.95. This has to be one of the best reasons to buy a modem I can think of (Pardon my editorializing but I am doing all the typing). I just called them and it isn't in stock yet. Till next month, see you at the CES.

Last night while sitting trying to figure out how many more months it will
be before I can get my memory/disk upgrade, so I can start saving up for a
compiler, an ironic and interesting thought occurred to me.

This Atari ST... we keep criticizing its low quality compared to the
Macintosh. This is probably justified; Apple I suspect put a lot more R&D
into the Macintosh; and it's the Commodore Amiga we really have to worry
about, anyway, since Apple lost the Turbo Pascal opportunity to Commodore.

But, if you read the interviews with the Apple engineers, it appears that
the Atari ST is more or less what the Apple engineers started out to build,
before the Mac started getting enhanced and improved into what it is now:
it had much lower resolution, was generally a smaller machine, and was much
less expensive.

Now, other than the fact that the Mac is so expensive, I personally think I
would rather have the Mac anyday. But it's kind of interesting to consider
this possibility that maybe the ST is sort of what the Mac started out as...

DISCLAIMER: I like the Mac! I just wish some aspects of it weren't so
obstinate...

MY theory of software evolution: (and what it is, too!)

Recently, there have been many people fretting out load about how the Atari ST will HAVE TO have loads and loads of software available when it hits the streets in order to be successful.

Every time I heard this, it provoked an immediate gut level response of "WRONG!" and finally it struck me what felt wrong about it. I present the following statements for your amusement:

1) There has yet to be a successful personal computer come out with more than minimal software at the time it gets on the shelves.

2) Having a set of "canned" software available hurts sales and popularity more than it helps.

3) The REALLY successful personal computers have become so due to third party software and hardware add-on's.

My reasoning is thus:

Looking back at the REALLY successful PC's (Thats Personal Computer in the generic sense) we have in order of appearance - The Apple II, the TRS-80 the IBM-PC the Commodore 64 and (perhaps) the Apple Mackintosh.

With the exception of the Mac, NONE of these machines had much more than a BASIC interpreter available when they first hit the shelves. In the case of the Mac, it's worse. You couldn't even program it, just draw pictures.

(I was there when the local Computerland uncrated the first IBM-PC they got for sale, and was helping them line up third party software support, so I know quite well what was ACTUALLY available at the time.)

The reason the machines appeared without much in the way of software is that software development costs much more, and takes longer than hardware development. The companies needed to sell some machines to make enough money to afford to pay for software development.

When a company develops a computer, they really cannot afford to wait the extra time required to develop software. This is due to the highly competitive nature of the business. Sales windows slam shut.

Four examples that come quickly to mind are the Japanese MSX machines, the Coleco ADAM, the Commodore +4 and the Sinclair QL.

The Japanese have spent so much time developing software that they think they needed to get into the American market, the market has passed them by. Even a top of the line MSX machine hasn't got a chance of selling if the Atari ST hits even near the quoted prices.

The Coleco machine had a full range of your "basic business needs" software including a Letter Quality printer for a reasonable price. Everybody liked the price and the printer, but couldn't stand the software. (At least those associates of mine who, after a few drinks, would confess to having actually purchased one.) ((The Adam bombed.))

The Commodore +4 was to sell to people who weren't interested in games. It also had all the "basic business" programs built in. Too bad you could buy a C64 and whatever programs suited you for less than the cost of the +4. (It has also bombed out)

The Sinclair QL comes with a suite of "basic business" programs, and form personal experience, I can say that it is a great little machine. Too bad the sales window is slamming shut on it - the phrase that comes to mind is 'too little too late'. (It may not get a chance to bomb out.)

The Buyers want CHOICE!

The thing that makes or breaks a PC is choice. Choice comes from third party support.

If a machine comes out with a great raft of "approved" or built in software, for better or worse this software becomes the "standard" for that machine. No matter how good or bad the software is.

Third party vendors have to sandwich their products in around this software and often meet active hostility from the manufacturer who sees them as unfair competition. (silly but true) This leaves the consumer with little in the way of choice, and throttles third party vendors.

A machine that does not have "pre-approved" software gives third party

vendors an open field and a much larger market for their programs. After a while, there is a vast choice of programs for users. More and more users buy the machine, because they can get software that they like (instead of what the manufacturer likes) and so even more machines are sold and more vendors support it and so on.

== Third Party Support ==

The ONE factor that makes or breaks a PC is the third party support. A manufacturer just simply does not have the resources to provide everything potential buyers want. The more software and hardware available for your machine, the more likely it will suit someones needs and the more likely a sale.

The likelihood of a vendor supporting your machine can be guessed at by how many units they expect to see out in the hands of users.

That number can be guessed at by considering the unit price of the machine and the price/performance ratio. (The CRAY has a very good price/performance ratio but there are not very many of them due to a high unit price.)

Of course, there are exceptions - the IBM PC has a (fairly) high unit price and a (fairly) low price/performance ratio. It sold because of the three initials on the front. And even that wasn't a sure thing, the current IBM P/X/At line is a fluke - remember the IBM S-100 box? And you do know that the PC failed in its target market - the home - do they still have the cassette and joystick ports on the PC?

The Commodore 64 became a big hit because of the usual factors. For one third the price of an Apple II you could get a system that except for the lack of card slots is superior to the Apple II. Even at the initial price of $400 the price/performance ratio was high. (At $200 even better)

The ST, IF it comes out near the rumored price and IF it has the features promised and IF Atari can keep from hindering third party vendors will be the Next Big Gold Mine and probably the most popular PC yet to hit the market. The lack of initial software will keep the bean counters from buying up the initial supply, leaving them available for small software houses and kitchen table hackers to buy so they can write the hordes of software the public needs to satisfy its needs. (figure 6 months - or about the time production really ramps up.)

Enough time on the soapbox - opposing arguments welcomed (I like mail too!)

[The above is One Hackers Opinion and not (yet?) the opinion of anybody or organization I know of. Keep computin' - Steve McIntosh @ Kontron]

Several of the programmers of Lucasfilm's Entertainment Game Division were at BAYCON `85 (the bay area science fiction-fantasy convention held in San Jose over Memorial day weekend) and in addition to showing two of their current games they also displayed two new games currently under developement which were shown at BAYCON for the first time anywhere.

Rescue at Fractalus:

In this game you are piloting a rescue ship whose mission is to save stranded pilots from the Jaggies (their real name is impossible to spell let alone pronounce). You cruise between mountain ranges and down canyons while being atacked by the Jaggies laser canons which you can destroy or avoid, all the while watching your radar to find grounded ships.

Once a stranded ship is found you must land and rescue the pilot. You better not wait too long before opening your airlock though, because the atmosphere is corrosive and will destroy the pilot's suit. Better not open it too soon as Jaggies like to hide in empty ships and you might let one aboard if you're not carefull.

The terrain is mappable and uses fractal mathamatics to generate realistic mountains and valleys. All the instruments in your complex control panel serve a purpose and when night falls (every five minutes) you're going to have to fly by instrument.

Not only is this game impressive but the opening graphics alone are better than many other games!

Ballblazer:

Here you control a pod across a checkerboard-like grid, the object is to blast the ball into your opponents goal posts which are moving back and forth across one side. Your opponent is of course trying to do the same thing by stealing the ball from you or using his repulsor field to blow it out of your grasp. The screen is split in two with one pod's view on top and the other on the bottom.

This game is incredibly fast and the resolution of the game grid as it

scrolls past (for both upper and lower screens) is amazing. The sound effects and music are also excellent.

Pirate copies of both these games exist in profusion, however these copies are apparently of the original 16k ROM games Lucasfilm was doing for Atari Inc. They were prototypes and did not have all the bugs worked out or all the features of the final versions which are 48k disks sold by Epyx.

Eidolon:

This is one of the games Lucasfilm has under developement. While searching through an old mansion you find a somewhat victorian-looking device hidden in the basement (sort of like an H.G. Wells time machine). Even though the machine is old it appears to be working, and when you enter it you find yourself suddenly traveling through an underground cavern filled with fireballs and an assortment of nasty and unusual monsters. The monsters are all fully animated at 60 frames per second (faster than movie film) and both the smoothness and the resolution of the animation is excellent. Although full sound effects were not avialable yet this game will undoubtedly represent state-of-the-art for micro-computer games. This game also requires strategy in order to get past the guardian to descend to lower levels.

Kronos Rift:

An ancient race, now long vanished, once used the planet you're on as an advanced weapons testing grounds. Many of the old systems remain and it's your job to patrol the surface in your tank and recover them for your government's use. But be careful, not all of the old weapons left worked properly and they can destroy you! Also watch out for the guardian saucers that patrol the planet to prevent the unathorized from stealing the weapons.

Your crew consists of a robot (whose name has to be changed to avoid copyright problems) who controls most of the systems onboard your tank. This game uses such tricks as having mountains in the background slowly fade into view as you approach them as if they're appearing through the clouds.

This was the least developed of the two new games but shows a lot of promise. All of the games use such techniques as pixel averaging (anti-aliasing) and several shades of grey scale to give the impression of much higher resolution than normal.

Both Rescue and Ballblazer are currently available for Atari Computers, Commodore versions should be available soon with Apple sometime later this year. Responding to a question from the audience one programmer said that they design for Atari computers first as they have the best graphic capabilities. Then they modify for Commodore, then Apple, and if possible IBM.

Kevin Thompson {ucbvax,ihnp4!nsc}!voder!kevin

"It's sort of a threat, you see. I've never been very good at them
myself but I'm told they can be very effective."

Summary:

One can hardly accuse Jack Tramiel of being ignorant of financial
management and margins. He only built one of the most successful
and profitable computer companies around.

You are right that the ST has a lower margin than the Mac. That's because
you're not paying for all that valuable advertising.

The MAC costs about $200 to make.   With the normal 5X basic cost rule
for hardware margins, it should sell at $1000, which is what it DID sell
for in the consortium schools.   At the $1000 price, Apple made a reasonable,
although not apple-like profit.   At the $2500 price, if there was a 40%
markup at the dealer, apple got $1500, or $500 extra per machine. And they
spent it on all that advertising.

Advertising sure adds to the value of a machine, so you know you got
your money's worth from your Mac.

I must take exception to this!

Saying "the ST is what the Mac started out to be before getting enhanced" is almost exactly the opposite of reality.

I've *seen* the ST and played with it, and can safely say:

1. Yes, it exists.
2. It is what the Mac should have been, but isn't.
3. It's essentially an improved version of the Mac at a third of the price.

If Atari can really supply it at the price they're quoting (and I still feel that's a big "if", regardless of what Tramiel may say), then for the price of a memory upgrade on a Mac you can buy a complete ST with 512k, a disk drive and a very nice high-resolution monitor.

The resolution on the ST is *higher* than the Mac, not lower (Mac is 512 x 384, ST is 640 x 400). The ST allows you to have color, but at lower resolution (a reasonable enough trade).

They put enough keys on the keyboard (yay!) and a second button on the mouse (interesting, but necessary?). The display is larger and crisper than the Mac's. The thing comes with 512k standard. They have provisions for a hard disk built right in from day 1.

Now, if only there were some software.... :-)

I'm seriously thinking of buying an ST. I wouldn't even dream of spending three times as much for an inferior machine.

However, I won't buy anything until there's some decent software; I also plan to wait for a few reviews before I jump in headlong. At the moment, though, I'm *very* interested in the ST.

Not a Rumor

In hopes of locating an Atari dealer here in the LA area, so that I could get on a waiting list (or something) I contacted Atari's West Coast distributer, Blatt inc.

I was told that although they have had many inquiries from dealers, they have not taken orders. This is because they do not yet have the official price and availability information from Atari.

They expect to have this information and start taking orders after the CES show is over. It seems that although Atari is not going to be exhibiting at the show itself, they will be there meeting with distributers.

here in the great white north, we expect to be picking up our
ST's either today or monday. i will be testing one at a friend's
home next week some time. they definitely are not vaporware.
i have also seen GEM for the PC in action. it's quite nice, but a
mouse is essential. i hope it runts at least as well on the ST.

According to the rep's at the Atlanta Comdex Atari Booth, you can get a
C Compiler & development tools for around $250! You think I want to stay
with THEIR operating system? I have not seen the Mac. I have played
with the Lisa. Thanks, but no thanks!

I'm looking at the LOW cost of getting into a 68000 based machine!

I have an Atari 130XE computer and have read things in the manual about
a RAM Disk that is available with the 1050 drive and 2.5 DOS. Apparently
it is intended for use with the extra 65K of RAM in the 130XE. I
don't have a 1050 but would like to have RAM disk capability working in
conjunction with my AT88 drives from Percom. Anyone familiar with how
to do this, please let me know. To further complicate things, I would
really like a RAM Disk version of OSS DOS-XL (I guess its back to the
old device handler tables again)!

*** REPLACE THIS LINE WITH a babel fish ***

I recently posted the following RUMORS to the CompuServe ATARI special interest group. At the time, I was fairly convinced that there were at least some bits of truth in them (one of my sources claimed that he was signed to a non-disclosure statement).

The rumors were (in descending chance of being correct):
1) The Commodore Amiga is rolling off of the Sanyo production lines.
2) The Hitachi advanced video chip is being used instead of the Amiga video chips.
3) The Amiga is using the same parts as the Sanyo MB-55 except for the motherboard and the logo.

Two of the sysops pinned my ears back. Here are their responses:

>Fm: SYSOP*Michael Reichmann 76703,2007
>
>   The information in your message regarding the Amiga is total
>rubbish! Vertually nothing contained in your "rumors" is true.
>   Due to non disclosures I'm unable to say more than that. Find a
>new source of information. Your current one is worthless.
>
>Fm: SYSOP*Steve Ahlstrom 76703,2006
>
>Your info ranges from poor to terrible! We'll all be able to judge for
>ourselves and comment on the relative merits of the 2 most sought after
>machines in a long time (ST and Amiga) sometime late this summer.

Well, I TRY to get the straight info... But those that know, dont talk
(very) much - which is the same as it ever was.

THIS IS A TEST THIS IS ONLY A TEST OF THE EMERGENCY BROADCAST SYSTEM

this is regarding the ongoing exploits of scott weisman and his 80
coluumn vt100 terminal emulator in action.
well, i have isolated the problem as to why my program isn't working. i
still haven't found a solution, though. a description follows:
the character set for the terminal is stored in a byte array 768 bytes
long(at 8 bytes/character and 96 characters). i do not compress the
chaaracters for simplicity, ease of implementation and speed. besides
the end result will not need the cartrige resident and thus have 8K
freed for buffering. well, as it is, the array refuses to be accessed
beyond the 32nd character(256th byte). i am completely at a loss for
this as the primary index into the array is declared as a card.
can anyone please help in this pursuit for the answer? thank you very
much for your help.

Prototypes are wonderful, but I'll believe the ST when I see it. The latest, per the San Jose Mercury News, is that the ST, which was supposed to be shipped to around now, will go to user groups next month. Also, the lower priced machine (128K???) that was to be sold in mass market stores has been cancelled, and the larger machine will be ready Real Soon Now. Atari claims 200 software developers workin on the machine, but nobody has been able to find a company admitting to this -- software looks to be as much vaporware as the hardware right now. Atari, which previously announced that the operating system would be in ROM for speed, has now recanted and said it will be on disk and loaded, so you lose a fair amount of your ram and your available disk and the speed advantages of the ST.

I've been following the Atari machine, both on the net and in the trade, and what I see is a highly ambitious product with minimal profit margins and a set of production specs that changes hourly. If I was a software developer, I'd be VERY wary of this machine, simply because it seems Atari isn't exactly sure how to build the turkey yet. If they did, they wouldn't keep changing the specs out from under themselves and delaying shipping. It is quite possible that the machine will get to market and be the greatest thing since sliced bread. My opinion is that talk is quite cheap, and until

I see a production level machine, all of this is so much vaporware. Prototypes are great, but I've see a number of products that almost never made it out of prototype stage because what you can build one at a time doesn't always translate to volume. Keep your eye on Amiga, folks, and if Atari gets its act together without going broke (again) first, then we can worry about the ST...

>... and a second button on the mouse (interesting, but necessary?).

Actually, yes. The one button mouse on the Mac is, in my opinion, its strongest weakness. I've hacked to some degreee with mice with from one button to four (and also a trackball, which has some advantages of its own) and I find the two button mouse to be the best tradeoff between functionality and confusion. You can easily get to either button, and you don't need to watch the mouse like you do with four buttons, and you don't need to use a 'Meta' key like you do with a one button mouse. Realistically, the Mac IS a two button mouse -- look at how much you use the <shift> key while clicking and dragging and imagine how much nicer it would be if you had that shift key on the mouse where it was convenient...

Saturday 6/1/85, I found a book titled "Presenting the Atari ST"
by L. English and J. Walkowiak, published by Abacus Software. The
Table of Contents is:

1. Introducing the 16-Bit Processors
1.1 The True 16-Bit Processors
1.2 The 68000 Processor
1.3 The 68000 Instruction Set
1.4 Advanced Features of the 68000

2. The Architecture of the Atari ST
2.1 Atari ST Interfaces
2.2 Floppy Disk Interface
2.3 The Hard Disk
2.4 High Speed Through DMA
2.5 The Printer Interface
2.6 The Serial Interface
2.7 The MF 68901
2.8 Sound Capabilities of the Atari ST
2.9 The MIDI Interface
2.10 The Atari ST Keyboard
2.11 The Atari ST Video Interface

3. The Atari ST Operating System
3.1 The CP/M Operating System
3.2 BDOS Functions
3.3 The BIOS of the Atari ST

4. Towards a User-friendly Computer
4.1 The Traditional Office
4.2 Prerequisities for a Friendly Computer
4.3 The Mouse
    4.3.1 Working With the Mouse

5. Working With GEM
5.1 Memus
5.2 Windows Under GEM
5.3 The Disk Directory
5.4 Working With Files Under GEM
5.5 Inside GEM
5.6 Virtual Device Interface
5.7 Appliction Environment Services

6. Communication Between Man and Machine
6.1 Computer Languages
6.3 Problem-Oriented Programming Languages
6.4 Interpretive Languages
6.5 Higher-Level Programming Languages

7. LOGO
7.1 Procedures in LOGO
7.2 Summary

This is quite a superficial book, containing only information that I would expect to find in the appropriate set of data-sheets, i.e. 68000, CP/M, GEM, LOGO, and some of the peripheral chips. The book contains a number of (typographical?) errors, such as no section

6.2 in the TOC (the last 3 sections of chapter 6 are number 6.2, 6.3, and 6.4 in the book itself). I have not read it completely yet, but a casual skimming revealed several other such errors.

The authors are German and the book was apparently written in German as Greg Dykma is listed as the translator. The cost was (I believe) $17.95.

I got my copy at:

Computer Literacy
520 Lawerence Expressway
Sunnyvale, CA 94086
(408)730-9955

and I believe they accept mail and phone orders.

Art Willis
Signetics Microsystems

{Usual disclaimers: I am not connected with Computer Literacy, Atari, Abacus Software, the CIA, etc., etc. Opinions may or may not be my own but should only be judged for neatness, clairity, and aptness of thought.}

Atari made an 11th hour decision to appear on the floor at the Summer CES. They had one of the meeting rooms in McCormick Place West. It was pretty crowded on Sunday and I didn't get to talk much. They were very stingy with hand-outs, although they were taking names to sent it later. I would like to clear up a little of the confusion about what will be available and when.

The 520ST is already shipping in Europe and Canada and will be available in the US next month (July) although the first few thousand will go to Atari User Groups. In the US, this version will be sold through Computer and Specialized stores. It will be available in a package at $799. This includes three software packages in addition to the 3 1/2 inch disk drive and the monitor.

The 260ST is the model that they were showing and that was drawing all the attention. It will be the 256K version and will be marketed through the mass merchants. The price will be $399 stand alone and $499 with the disk drive. No software was mentioned. This version will be available in September (give or take). It is definitely packaged in such a way as to be different from the 520ST.

The 130XE is available now and is the only 128K machine Atari plans to bring out. It first shipped in March and according to James Copland "they sold out in a week".

Atari has put development of the 32 bit machine on the back burner to
concentrate on the 260ST. I can be brought to market quicker and
according to Copland "We only have so much fuel in the gas tank".
One suspects, also, that they only have so much money in the til.
Rumor has it that nearly everyone at Atari not directly associated
with the ST project has been laid off to save money.

I didn't have a chance to find out about the GEM but it will probably
be on disk for the 520ST, at least initially. It will almost assuredly
be in ROM for the 260ST since this model is targeted more for the
home user that the business user and I suspect that Atari figures
most home users will be happy to have GEM built in.

This doesn't answer all the questions, especially about software, but
I hope it helps...

>

With one hand on the mouse, I have another hand free to operate a whole keyboard full of buttons. With the shift, option, and command keys I can get about 16 (?) functionalities out of the one mouse button and then there's all those characters. Since using two hands at once comes quite easily, I feel that one mouse button is perfect.

In response to Kit's request, here is the text of two bulletins concerning Atari and the CES from Antic Publishing. They were offloaded from COMPUSERV Information Service, the Atari SIG, Data Library 7.

There were actually 3 bulletins available. I am including only these two because the other one was a very detailed description of new game offerings for the Atari from Lucas films (detailed and *long*). One of these 2 bulletins is also long, but I hope of wide enough interest to justify posting. Especially the part about the CD with the encyclopedia on it...and how they did it!

Sunday, June 2, 1985

Chicago, IL--Atari Corp. introduced two new computers at the summer Consumer Electronics Show today, and is expected to make more major announcements tomorrow.

Atari introduced two new computers, the 260ST and the 260STD.

The 260ST is a 256K version of the 68000-based 16-bit ST machines previously announced by Atari.

According to Atari marketing official Brian Kerr, the new machine is expected to retail in the $399 range and will be shipped this fall.

Atari also announced the 260STD, identical to the 260, with the addition of a built-in 3-1/2 inch disk drive. Kerr said the expected price is $499.

Both of the 256K machines will have the operating system and Graphics Environment Manager (GEM) built in ROM, according to Kerr.

However, the long-awaited 520ST, which is now scheduled for shipping in July, will have an operating system installed in RAM, according to Kerr.

The company is expected to announce a read only memory device in the form of a compact laser disk for use with the new ST computers.

Although not officially announced, the CDROM was designed by Activenture in Monterey, Calif.

Activenture demonstrated the CDROM privately to Antic shortly before the Consumer Electronics Show, where we learned that the CD has a 500 megabyte capacity.

The first product available on the CDROM will is expected to be a 100 megabyte encyclopedia from Grollier.

Called an "inverted database" by its developers, the CDROM encyclopedia lets users type in words or strings of words to be searched throughout any portion of the text, all 20 volumes of the encyclopedia.

Further details are expected tomorrow, when Atari officials have promised to introduce the product.

by Michael Ciraolo

Chicago, IL -- Imagine always having an encyclopedia available on your Atari, as readable as a conventional book, but as searchable as an industrial database.

Imagine, also, that you could search through 26-volume's worth of encyclopedia for term's such as "Costa Rica" and find 57 references in less than three seconds.

And imagine a $500 price tag for this technology.

Such technology, under development by Activenture in an exclusive agreement with Atari, was demonstrated at Atari's CES booth today.

Called a CDROM, the technology includes a compact laser disk player connected to the direct memory access port (DMA) on an Atari ST, according to Activenture's engineering vice president Tom Rollander.

The CDROM can hold a half gigabyte of information (500 megabytes), although the encyclopedia demonstrated occupied only a quarter of the disk's actual space.

Rollander told ANTIC that independent publishers would announce specific products for use on the CDROM in the future, starting with the encyclopedia, and with more products introduced in the fall.

Atari officials would not name the exact price or release date of the CDROM, and said they were still discussing whether Activenture or Atari would distribute the product.

Rollander said the CDROM "would be available in the fall."

Using the CDROM, you can browse through text, exactly as you might with a hard-copy volume from an encyclopedia, using the mouse for control. You can move foward or backwards by page, choose individual volumes, chapters or entries and so on.

You can also specify any section of text for dumping to a printer, Rollander said.

Or you can search for specific words or phrases, using powerful techniques familiar to industrial database subscribers.

Specify a word or phrase and look for it in all of the text, in bibliographies, in tables, in subheadings, in specific entries, or in combination with other unspecified terms.

Regardless of the search you choose, the computer screen will tell you how many entries were retrieved and let you look at each one. In each case, the text is black on white, with red cursor control and green highlighting of the chosen word.

The amazing speed of the CDROM search is the product of previous indexing, said Rollander. In fact, the computer is not searching the text of the encyclopedia each time, but is searching a specially prepared index, which is larger than the actual text.

The full text of the encyclopedia occupies 58 megabytes, while the index structure takes up 60 megabytes.

"We've traded hours of processing time on a VAX for the data storage capacity of the compact disk," explained Rollander.

His company took the magnetic storage tape used by typesetters and professional database suppliers and dumped an encyclopedia into a VAX computer.

Using the VAX, Activenture identified, indexed and cross-indexed 141,000 unique words in the text, producing a structure Rollander called "an inverted database".

The entire disk has a half gigabyte capacity, the same amount as 100,500 standard floppy disks, said Rollander.

THE INFORMATION AGE

Atari officials were ecstatic and called the CDROM "the most important innovation since home computers".

"This is what computers are all about," said one Atari marketing manager. "This will change everything. This is IT!"

Other reaction to the CDROM was mixed. In a crowd of distributors, retailers and members of the press, many people expressed their enthusiasm to ANTIC. Others were simply speechless.

"We asked ourselves 'What are most people doing with computers in the home?' They're using them as doorstops, playing games with them and eventually throwing them in the closet," said Rollander. "Now there's a real reason to use the machines."

"I expect resistance from many publishers, but eventually CDROMs will have greater market penetration than current encyclopedias," Rollander predicted.

Nor is optical storage/inverted database technology limited to encyclopedias. Rollander said the principle may be applied to cookbooks and airline guides, and that his company was talking to a variety of other publishers.

"I expect to see publications in the $100 to $150 range at first, dropping to $50 in time," he said.

The cost of such optically stored databases is not high for two reasons: Activenture's indexing procedure uses the magnetic tape already in common use by publishers, so computer input is simple, with most books already existing on tape.

Rollander also indicated that material stored on microfiche could easily be read, so databases of journals, the New York Times and out-of-print materials could be produced.

Then there's the technology of the compact laser disk. Mastering such a disk costs only a few thousand dollars, and the mass production cost is less than that of magnetic tapes and disks.

Because optical disks are mastered and pressed like records, there are no recording heads to wear out and no lengthy time spent making a recording, said Rollander.

INFOMANIACS DELIGHT

There is distinct pleasure in discovering all of the references to a particular word, references that you might never have found if you had simply looked up a primary entry.

For instance, Rollander demonstrated a search using the word "toothache". In addition to the expected references under dentistry, he also found mentions in connection with cloves, henbane and certain painful medical procedures developed during the Middle Ages.

The CDROM "gives students more appreciation for information than they get by simply looking up the subject," said Rollander.

(ANTIC Note: CDROMs are capable of storing object code (programs) as well as text. In the near future, exclusive Activenture interviews with ANTIC will reveal other potential types of CDROM-based information, such as videotapes, photographs, and software.)

I was looking forward to the reports from ANTIC at June's CES, but
have not seen anything on the net yet. Does anyone know if ANTIC
posted reports to CompuServe ?

One recent rumour I heard was that, though the first ST's will not have
GEM in ROM, they are all socketed for when GEM becomes stable. I also
heard that there may be a 256k version with a built-in disk.

Does anyone know whether the composite video output has actually been
cancelled ?

David Rowley.

by Michael Ciraolo

Chicago, IL--New products for
the 8-bit Atari computers
include two new games from
Lucasfilm, distributed through
Epyx Software.

The two games, scheduled for
release this fall, are Koronis
Rift and The Eidelon.

Lucasfilm team leader Noah
Falstein said of his team's
game, The Koronis Rift: "It's
the year 2249. An ancient
coalition of races once existed
throughout the galaxy. They've
left behind artifacts.

"You're a techno-scavenger,
hunting for artifacts when you
find the motherlode of finds, a
weapons testing ground."

Weapons are the most sellable
of items, so you drop down to
the surface of Koronis to
scavenge. Of course, the

ancient races left behind a variety of weapons, defenses and anti-detection devices, all protected by genetically engineered Guardians.

There is one remaining Guardian base at the end of the Rift, a Grand Canyon-like chasm, which can only be destroyed with the right combination of weapons systems.

"You are armed only with puny weapons when you start," said Falstein. "But you work your way up -- acquiring detection gear, weapons, shields, anti-detection equipment. As you get better equipment, you run into tougher guardians."

Koronis Rift is a multi-strategy game, and there is no one solution to the game. "It takes the right combination of weapon systems to get to the base at the end of the Rift," said Falstein.

"As I see it, this is played the way you play a text adventure. There will be an Encyclopedia Galactica to provide information on the races leaving the systems, and you have to consider clues and strategy to reach the base at the Rift's end."

The game also works on other levels. Each weapon system is color coded, so a blue shield is the best defense for a blue laser, not so good for a purple laser, and no good for a red laser.

As one would expect from Lucasfilm, each game is breathtaking, both for game design and for programming innovation. Koronis features a

cleaner version of the fractal landscape generator used in Rescue on Fractalus.

Not only are you presented with the pilot's view, control panel and overhead monitors, but Koronis also includes incredible GTIA animation produced by Jim St. Louis, who produced the introductory scene in Epyx's final version of Rescue. (Ed. Note: St. Louis was also the artist who created the famous Robot & Rocket demo graphics, used by Atari at the January CES)

The Eidolon takes you back in time, to the 19th century.

You've ventured into you uncle's dusty basement, and there it is, dials still glowing. But what is the Eidolon? According to Lucasfilm team leader Charlie Kellner, it's a magic time machine, a la H.G. Wells. The inventor left a few notes, but...

You start up the Eidolon, and find yourself in a cavern. You start running into things, and as they get more fiercesome, you get the feeling you're approaching the center. But of what?

Kellner won't say. But he did let on that the cavern, while immense, is not infinite. Indeed, it's the same cavern each time you play, and thus mappable.

"It's partly a voyage of discovery, partly a quest to get to the end," Kellner said.

Eidolon uses animation techniques never before used in

home computers, according to Kellner. The characters in the game -- dragons, trolls and greps -- are produced by cel animation, the same technique used to animate Fred Flintstone and other cartoons.

Without using Player/Missile graphics, Kellner said, the animation for any one character is composed of four to six overlayed cels (from celluloid). One cel might be a leg; moved, you see a character walking, while the head is held motionless.

The Lucasfilm team's programming keeps the creatures moving logically against a three-dimensional background. "The characters are drawn in real-time, directly on the graphics screen," Kellner said.

The games are to be priced in the $29 to $35 range, and will be shipped in the near future. No specific ship date was given by Epyx.

What's next from Lucasfilm? The team leaders wouldn't say, but both did mention their, and George Lucas' goal: interactive movies. While that may be five to ten years away, "interactive cartoons are a good first step," according to Kellner.

Chicago, IL -- Imagine always having an encyclopedia available on your Atari, as readable as a conventional book, but as searchable as an industrial database.

Imagine, also, that you could search through 26-volume's worth of encyclopedia for term's such as "Costa Rica" and find 57 references in less than three seconds.

And imagine a $500 price tag for this technology.

Such technology, under development by Activenture in an exclusive agreement with Atari, was demonstrated at Atari's CES booth today.

Called a CDROM, the technology includes a compact laser disk player connected to the direct memory access port (DMA) on an Atari ST, according to Activenture's engineering vice president Tom Rollander.

The CDROM can hold a half gigabyte of information (500 megabytes), although the encyclopedia demonstrated occupied only a quarter of the disk's actual space.

Rollander told ANTIC that independent publishers would announce specific products for use on the CDROM in the future, starting with the encyclopedia, and with more products introduced in the fall.

Atari officials would not name the exact price or release date of the CDROM, and said they were still discussing whether Activenture or Atari would distribute the product.

Rollander said the CDROM "would be available in the fall."

Using the CDROM, you can browse through text, exactly as you might with a hard-copy volume from an encyclopedia, using the mouse for control. You can move foward or backwards by page, choose individual volumes, chapters or entries and so on.

You can also specify any section of text for dumping to a printer, Rollander said.

Or you can search for specific words or phrases, using powerful techniques familiar to industrial database subscribers.

Specify a word or phrase and look for it in all of the text, in bibliographies, in tables, in subheadings, in specific entries, or in combination with other unspecified terms.

Regardless of the search you

choose, the computer screen will tell you how many entries were retrieved and let you look at each one. In each case, the text is black on white, with red cursor control and green highlighting of the chosen word.

The amazing speed of the CDROM search is the product of previous indexing, said Rollander. In fact, the computer is not searching the text of the encyclopedia each time, but is searching a specially prepared index, which is larger than the actual text.

The full text of the encyclopedia occupies 58 megabytes, while the index structure takes up 60 megabytes.

"We've traded hours of processing time on a VAX for the data storage capacity of the compact disk," explained Rollander.

His company took the magnetic storage tape used by typesetters and professional database suppliers and dumped an encyclopedia into a VAX computer.

Using the VAX, Activenture identified, indexed and cross-indexed 141,000 unique words in the text, producing a structure Rollander called "an inverted database".

The entire disk has a half gigabyte capacity, the same amount as 100,500 standard floppy disks, said Rollander.

THE INFORMATION AGE

Atari officials were ecstatic

and called the CDROM "the most important innovation since home computers".

"This is what computers are all about," said one Atari marketing manager. "This will change everything. This is IT!"

Other reaction to the CDROM was mixed. In a crowd of distributors, retailers and members of the press, many people expressed their enthusiasm to ANTIC. Others were simply speechless.

"We asked ourselves 'What are most people doing with computers in the home?' They're using them as doorstops, playing games with them and eventually throwing them in the closet," said Rollander. "Now there's a real reason to use the machines."

"I expect resistance from many publishers, but eventually CDROMs will have greater market penetration than current encyclopedias," Rollander predicted.

Nor is optical storage/inverted database technology limited to encyclopedias. Rollander said the principle may be applied to cookbooks and airline guides, and that his company was talking to a variety of other publishers.

"I expect to see publications in the $100 to $150 range at first, dropping to $50 in time," he said.

The cost of such optically stored databases is not high for two reasons: Activenture's indexing procedure uses the

magnetic tape already in common use by publishers, so computer input is simple, with most books already existing on tape.

Rollander also indicated that material stored on microfiche could easily be read, so databases of journals, the New York Times and out-of-print materials could be produced.

Then there's the technology of the compact laser disk. Mastering such a disk costs only a few thousand dollars, and the mass production cost is less than that of magnetic tapes and disks.

Because optical disks are mastered and pressed like records, there are no recording heads to wear out and no lengthy time spent making a recording, said Rollander.

INFOMANIACS DELIGHT

There is distinct pleasure in discovering all of the references to a particular word, references that you might never have found if you had simply looked up a primary entry.

For instance, Rollander demonstrated a search using the word "toothache". In addition to the expected references under dentistry, he also found mentions in connection with cloves, henbane and certain painful medical procedures developed during the Middle Ages.

The CDROM "gives students more appreciation for information than they get by simply looking up the subject," said Rollander.

(ANTIC Note: CDROMs are
capable of storing object code
(programs) as well as text. In
the near future, exclusive
Activenture interviews with
ANTIC will reveal other
potential types of CDROM-based
information, such as
videotapes, photographs, and
software.)

I AM LOOKING FOR A USED ATARI 1050 DISK DRIVE.
IF YOU HAVE ONE YOU WOULD LIKE TO SELL, PLEASE
GIVE ME A CALL AT (503) 685-3632 OR SEND EMAIL TO:

tektronix!iddic!chrism

I AM ALSO LOOKING FOR A HAPPY MOD FOR THE DISK
DRIVE. ANY RECOMENDATIONS ABOUT THE MOD, WHERE
TO GET IT, HOW WELL IT WORKS, ETC, WOULD BE
APPRICIATED.

THANX,

CHRIS EBAUGH

Here are my first impressions of the software from the Summer CES show:

Several software companies did not have booths at CES. Those that did had very few new releases and in fact seemed to have cleaned up their catalog quite a bit. If there are any old games that you want to get a copy of, I suggest that you watch the sale racks or contact your favorite software store about getting copies before it is too late.

EPYX: Besides the two lucasfilm games already released, they were showing two more under development. Kevin Thompson did a nice review on these a couple of days ago. They definitely said that they will not be developing a version of ROGUE for the Atari computer systems.

DATASOFT: Their catalog shows that they are going to release the whole ALTERNATE REALITY series for the Atari and this is still the plan as of the time of the show.

ACTIVISION: Several of the new releases are only for the C64 although they said the Atari version has not been ruled out. Of the ones announced for the Atari, MASTER OF THE LAMP, THE GREAT AMERICAN CROSS-COUNTRY ROAD RACE and the SLOT CAR CONSTRUCTION program (forget the exact name) look like the best of the lot. I got to talk to the designer of the GREAT AMERICAN CROSS-COUNTRY ROAD RACE and play with it for awhile. The graphics are very good and there are several games in one; you can run one leg of a race from one city to another or the whole continent. You choose the route and the starting time (this affects the traffic in the cities depending on what time you get there). There is a scoreboard where you can enter your name if you are in the top 10 and it writes the scoreboard back to disk so it is saved until someone beats it. You even enter the date so you will

know when you did it. I read one review the didn't give it a very good review but I was impressed.

I'll cover some more of the latest software news later but I wanted to get some of it on the net for all to enjoy.

by Michael Ciraolo

Chicago, IL--While many
companies are instroducing one
product apiece for the Atari

STs, one company has announced an entire line of ST products.

Haba Systems, headquartered in Van Nuys, Calif., will release a word processor (HabaWord), a file and report manager (HabaFiles) and a spreadsheet and graphics package (HabaCalc N Graph) in September for $59.95 each, according to Charles Becker, vice president for sales.

A communications program, not surprisingly called HabaCom, will be released in August for the same price, Becker said.

The company, which produced the integrated spreadsheet, word processorand database /// Easy Pieces for the Apple ///, will also release Hippo C and a checkminder program in late July or early August.

Becker added that all of the Haba applications will feature pull-down menus and point-and-click editing.

Haba, which has written over 10 products for the Macintosh, will port all of its current and future programs from the Mac to the Jackintosh, starting in January 1985, said Becker.

In addition to its line of software, Haba told ANTIC they will sell a 10 megabyte hard disk for $499 and a fully Hayes-compatible modem for $299. These products are called HabaDisk and HabaModem.

For people who are less than comfortable or fluent with computers, Haba offers Haba Software Solutions. Each retailing for $49.95, titles include How to Prepare and

Manage a Home Budget, how to Write a Resume, How to Start Your Own Business, Business Forms, How to Prepare for the S.A.T., and so on.

The 46-member company is named for founder and chief executive officer Chaz Haba, who was director of marketing for Fairchild Semiconductor and who has started several small computer companies.

Becker said the Atari STs' combination of 68000 processor technology, GEM operating system, mouse, serial and parallel ports, 40 and 80 column mode and game (cartridge) port make the ST a "true industry leader," especially in light of Jack Tramiel's "genius for launching exciting, innovative and well-conceived products."

****

ANTIC EDITORIAL NOTE:

Antic's CES coverage will be completed Monday, June 10th. We're going to wrap up the events of the past week and shed more light on the Atari presence at the 1985 Summer Consumer Electronics Show. Expect two more reports (ANTIC6.CES and ANTIC7.CES).

Here is the second installment of my first impressions of the software
from the Summer CES show:

TELARIUM: They have some good graphics/text adventure games but none are
     available for the Atari and may never be.

ELECTRONIC ARTS: They continue to bring out excellent products. The
     latest available for the Atari is ADVENTURE CONSTRUCTION SET
     that allows you to write your own adventure. It also contains
     one full length adventure and 7 mini-adventures. Note, these
     are not text or graphics adventures but action adventures in
     the mold of SHAMUS. Their two newest releases (not out yet)
     are for the C64 only, at first, but Atari might be added.

BRODERBUND/SYNAPSE: I'll group them together since they put out one
     combined catalog. Synapse have three releases in their

'Electronic Novels' series. These are text adventures set in a real-time universe that changes continuously. They are MINDWHEEL, ESSEX and BRIMSTONE (the newest). They are all available for the Atari computers. Another new release is LETTERHEAD, an integrated package that includes a word processor, an address file and graphics capability. It includes on-screen windows and a set of simple commands that let you design letterhead and stationery. It supports mouse, joystick and keyboard control. A new graphics adventure game, THE SERPENTS STAR, is a sequel to THE MASK OF THE SUN and is available for the Atari. BLUE MAX 2000 is available with Atari on one side and Commodore on the other. Several of the new games, though, are being released in C64 format only.

These are a few of the things I saw at the CES. I picked up several catalogs of other software but I didn't have a lot of time to see if they would be available for the Atari in the future. If in doubt, I didn't mention them here. Hope you have enjoyed these reports as much as I enjoyed the show.

   The ramdisk capability of the 130XE has nothing to do with the type of disk drive you use but of the additional bank-selected 64k block of memory available with the 130. On the DOS 2.5 disk is a binary utility file called RAMDISK.COM, once DOS is booted go to the DOS menu and do a binary load with option L. This will configure the additional 64k to function as a disk in RAM with the address D8: (note that this drive supports only 499 free sectors so the J copy disk option in the DOS menu won't work), it also copies DUP.SYS to ramdisk and establishes a MEM.SAV file. If you go from BASIC back to DOS your program will be stored in D8:MEM.SAV and the DOS menu will also be loaded from drive #8. Fast!

   To free-up as much ramdisk space as possible and to use drive #1 for DUP.SYS and MEM.SAV first purge these two files from RAM by using option D from DOS (BASIC XL users can enter ERASE D8:*.* - at least I think BASIC XL will talk to a drive #8). Then you must do a POKE 5439,ASC(`1') from BASIC to tell DOS to use drive #1 (the `' around the 1 are actually quotes).

   RAMDISK.COM can be loaded off of any Atari-compatible disk drive but loading it into only a 48k or 64k machine will result in nothing happening (at least nothing happens from an 810 into an 800, it loads but does nothing). The documentation seems to say that the ramdisk capabilities will work ONLY with DOS 2.5, so DOS XL - or any other DOS - probally won't work.

   DOS 2.5 with all its utilities should be available from most user groups and bulletin boards and is supposed to be package with all new 1050 drives. Other utility files included on the DOS2.5 master disk are COPY32.COM - which will copy DOS 3.0 files to DOS 2.5 (by the way, DOS 2.5 is supposed to be completely compatible with DOS 2.0S), DISKFIX.COM - which should fix any problems between versions 2.5 and 2.0S in addition to being able to re-store erased files that havn't been written over, and SETUP.COM - which will create AUTORUN.SYS files.

   Speaking of ramdisks, the June issue of ANALOG Computing has an article titled `V: A Memory Storage Device' which will allow you to create a ramdisk in any model Atari computer. You can list or save to the handler V: but as it does not support a directory it can hold only one file at a time. Depending on the amount of free RAM in your system it is NOT erased by going to the DUP menu! This makes it hundreds of times faster than using a MEM.SAV file.
   V: is extreamly useful for clearing the variable table of BASIC programs by listing the program to V:, then typing NEW, entering from V:, then saveing to disk. It also comes in handy for merging program segments or re-arranging them. The program is reset safe and it's only limitation seems to be dependent on your available RAM and that you can't use any DOS copy functions as they will almost certainly wipe out anything in V:.

One of the guys from the above store went to the show in Chicago
and told Epyx about my problem. Epyx is aware of the problem
and will soon release a version that will run on all disk drives.
So, unless you have an Atari drive, you will have to wait a bit.
Anyways, I highly recommend the Lucasfilms games and will be
impatiently waiting for the two new titles.

I have heard rumors that someone may be producing a 6502 simulator for the new ST series so that old 400/800 software could still be used. Any information on such stories? A 6502 simulator would not be difficult to create on a 68000; however, it would probably be difficult to simulate the old hardware organization. Such a simulator would give a lot of software to the ST users though, and since I have so much software for my 800, it would make a transition easier.

well, that is a problem with internal character sets, but since my program doesn't use an antic character mode it doesn't matter. anyway, that problem is now licked. i now have new problem -- i can't seeem to get to do any type of i/o with the serial ports. well, at least input. i can do output if no input is attempted. i tried some techniques from john palevich's kermit program(because it's in action)but have had limited success. so, any answers to this one?

Keywords: one button mice, dumb idea
Xref: watmath net.micro.mac:1661 net.micro.atari:874
Summary:

I have been using a 3 button mouse here at work (on a Valid
workstation) for several weeks. Prior to that my only exposure to mice
had been on the Mac and Lisa, both of which I've used extensively. I
found it quite easy to adjust to the three-button rodent - in fact,
using a Mac seems more cumbersome now than ever.

I find that having to switch my attention between the keyboard and the
mouse is annoying, and the three-button mouse keeps this to a minimum.
If I am going to do something with the mouse, I want to use only the
mouse, not some crazy "control-options-escape-left elbow click"
manuver. Same with the keyboard.

A one button mouse simplifies the learning process. But Apple forgot
that people aren't in the learning process forever.

When atari first put the XL's out, they claimed that removing and inserting
cartridges while having the power on would not do any damage to either
the computer or the cartridge. I have never tested this out (i have an
old atari 800), but I know some people who do (and have removed carts before)
and never had any problems.

Summary:

This is the same thing as pulling out MOS chips with the power on;
nothing happens most of the time, but manufacturers strongly
recommend against it anyhow. There certainly is a danger that something
will pop, in spite of the elaborate precautions taken by most
manufacturers. The Atari carts. do not have any special protection,
they're just pcb's with ROMs, or perhaps EPROMS, and the same
precautions ought to be taken.

[munch, munch, munch... burp!]

I saw a program called 'Advanced Music System' for the Atari that plays
music while a graphic keyboard displays the piano keys pressed.

Specifically, I would like to get a copy of the documentation for it.
Before you start flaming, I was told that this program is public domain.
(can anyone confirm this fact for me too?)

If some generous person would let me know he has the documentation,
I would gladly arrange a SASE and copy cost reimbursement to be sent
out. Please mail responses. Thanks in advance!

[Will this go the way of the ...]

Hello all,

     I am an interested, but uninformed hopeful ST buyer, and I
was wondering:
     1- Will Atari be able to pull off this product:
          i- By the time they have promised.
          ii- At the price they promised.
     2- How good or bad is GEM as an operating system, and/or
        as a development environment.

I will post any really neat responses to these and any other comments I
receive on this subject.

                    Does anybody love anybody else?

Unless some announcement has been made that I haven't heard, Advanced Music
System is not public domain. It is one of the programs formerly sold by the
Atari Program Exchange, and is thus a commercial program. I do not know if
it is still available, although DynaComp and ANTIC (and others?) seem to be
selling some of the APX programs now that APX is dead.

[is the line-eater bug just a myth foisted upon us by the old-timers?]

Greetings, Atarians!
Anybody out there have one of these things? Quoting from the July 84 Antic:

"The R-verter allows you to use most modems and other RS232 devices with
your computer without using an interface module. The software package
includes a smart-terminal emulator and an RS232 device handler. It
requires no other peripherals, doesn't use a joystick port, and comes
with a built-in 3-foot cable. It's said to be compatible with any RS232
device that accepts TTL-level inputs (most do)."

I'd like to connect my Signalman Mark I stupid modem to my 800, but I
don't have the $50 to spend on this device. I can make my own cable,
but I need a pointer to some PD terminal software that will do this, if
such a thing exists.

Thanks.

There is a company that advertises in ANTIC called LOTSABYTES that
sells several public domain disks that have AMS music on it and
includes a player piano built in. In addition, they sell a program
on disk called ADVANCED MUSICSYSTEM II that allows you to create
music with your ATARI computer. They claim it is an all new machine
code program that allows you to 1) control pitch duration, envelope
dynamic level, meter, tempo and key and 2) 4 independent voices and
3) 5 octaves per voice and 4) save up to 8200 notes. It includes a
custom DOS and full instructions on a 24K disk. Their address is:

     LOTSABYTES
     15445 Ventura Blvd.
     Suite 10G
     Sherman Oaks, Ca. 91413

The cost of ADVANCED MUSICSYSTEM II is $14.95 plus $1.95 S & H.

Hope this helps...

<pardon the dust... this is my first net message>

     I just aquired KERMIT for the Atari and got it working with

my 850 interface and my acoustic modem. But what I would like to
is get it to work with my Atari 1030 direct connect modem. I have
the INCLUDE file for the 1030 but can't get it to work with my T:
driver written by Jim Steinbrecher. I was looking through the source
and it does things that Jim's driver doesn't support. So it makes me
think there is another T: driver out there.
     If anyone has KERMIT running using an Atari 1030, I'd like
to get a copy of the driver and/or modifications needed to KERMIT.

              Thanks,
              Russell Schwartz

I plan on buying a new Atari 1050 disk drive. The price of these has been coming down recently and for $145 its not a bad idea to have a spare. My question is whether is planning on discontinuing these units in the near future.

> Epyx, a computer game company, now has both Rogue and Empire available
> for Atari computers. They were announced at the Las Vegas CES show and

> are adaptations of their mainframe origins.

While I enjoy playing Rogue, and I enjoyed (past tense [we don't have it anymore]) playing Empire, two questions come to mind.

1) Will the Epyx versions be *just* like the main-frame versions?
     I think not. There is not enough memory on the Atari computers to run a program as complex as Rogue or Empire. The code for Rogue is over 250K. There are over 80 monsters in the version that I play. Add to that: various weapons, armor, potions, scrolls, wands staffs, rings, etc. And don't forget about the randomly generated rooms, halls, traps, and other things. It just won't fit in 48K, 64K or even in the 160K (you can get that high if you have a 128K RamPower).

2) Which version of Rogue and Empire will be released?
     There are as many versions of Rogue as there are machines that it runs on. There are two versions on this machine alone. And what about Empire? Which version will that be? Will they release the original (where you play against the machine) or the version that we had here (where different players played against each other)?

One final comment. When I read the article in Antic about the release of both Rogue and Empire, I called 10 different places that carry Atari software. Everyone said the same thing: "Never heard of it." They may both turn out to be like BallBlaster. Lots of copies exist, but you can't buy one to save your soul.

Pulling out carts while the power is on should be OK, as long as you
don't short the contacts of the edge connector.
Most board failures caused by pulling the board out with power on are in fact
caused by pulling the card out crooked & shorting all the bus pins together.

Pulling the board out straight is probably OK.
However, if your kids are doing it, there is no guarantee that a non-crooked
pull will happen !!!!

Hello, fellow ATARI owners!
My name is Alex and basically what I'm trying to do is to get a small
ATARI users group in the area of NYU. If there are any interested
"ATARIANS", please send me mail directly to axk835@acf4 or just reply
back to the net.

Signed, a devoted ATARIAN.
Alex Kriger.

P.S. Another way to get in touch with me is to see me at 14-Washington place
computer center on Tuesdays from 3-6 p.m., where I work as a consultant.

Don't get your hopes up, I talked to the Epyx people at the CES show
and they have no current plans to port these to the Atari. They, like
many others, are taking a "wait and see" attitude. I just got a
retailers information sheet from Epyx and the only new games they show
available for the Atari are the two Lucas games.

Hopefully Atari will be able to convince software developers that the
machine isn't dead and that we users are hungry for new, GOOD,
software.

Has anyone seen Alternate Reality on the shelves yet?

Just because a software product is announced at the CES show, doesn't
mean it is immediately available. Many of the games announced at the
Summer CES that I attended last year were not available until almost
Christmas time. I wasn't able to get Spy-vs-Spy until late November.
In addition, many of the programs will be available mail order before
they are available in your local store. Many of the owners of these
places are real fans and make an effort to get the newest programs as
soon as they are available. When did EPYX say these games would ship?
They usually announce availability at the same time.

Here here! And, no, I haven't seen Alternate Reality yet, but I am
hungrily awaiting same. What's the news on the Trillium stuff?
Anything happening there?

I wrote a version of rogue 5.2 w/52 monsters and more armor/weapons/stuff,
and it fit (tightly) on one sssd disk. I wrote it in 6502 assembly, and
with a little disk action for the map generator, and the not-so-often used
strings, it worked fine. I even had about 3-4k left over for other stuff I
might add.

[warning, >32767 characters]

Well, here are the sources to KERMIT for the Atari written in Action!
Too bad there wasn't a net.micro.atari.sources... oh well... I'm surely
not going to put it in net.sources. I suppose I could use a few good flames.

The files are:
     KCOM1030.ACT KCOM850.ACT   KERMIT.ACT   KERMIT.DOC
     KERMIT.PNS   KFUNC.ACT KIO.ACT   KMENU.ACT
     KPRO.ACT KTTY.ACT

Have fun!!

     Russell Schwartz
     ...!tektronix!reed!omsi

P.S. If anyone can get the 1030 stuff to work, let me know.

P.P.S. Oh yea, the filenames are in the first line of each file
       and files are seperated by "<cut>". (I don't like messing
       around with shell scripts.)

; --- END OF D:KERMIT.ACT ---
<cut> D:KERMIT.DOC
How to install Kermit on your ATARI
home computer.

RAM:  48K, or more RAM
Peripherals:  At least one disk drive
              ATARI 850 & a modem, or
              ATARI 1030, or other
              communications device

1)  Format a diskette and write a copy
of DOS onto it.

2)  Write the AUTORUN.SYS file for the
type of modem that you are going to
use.  If you are using an 850, write
the AUTORUN.SYS file that came with the
DOS II Master Diskette.

3)  Write all the K*.* files onto the
diskette.

4)  Insert an ACTION! cartridge into
your ATARI computer, turn on your 850
(or 1030, or whatever) and power cycle
```

your ATARI computer. After the DOS boots you should see the ACTION! editor screen.

5) Read in and edit the file "KERMIT.ACT". Change the line near the end of the file from "KCOM850.ACT" to whichever device you wish to use. Write out the "KERMIT.ACT" file when you are done. If you are trying to support a new modem type, create a new KCOM file and use its name here....

6) Clear the editor buffer and go to the ACTION! monitor. Type
R "KERMIT.ACT"
to compile and run the Kermit program.

That's it. Here are some commonly asked questions, with some off-the-cuff answers:

Q: Why do I need an ACTION! cartridge to run Kermit?

A: The people who developed ACTION! have not yet provided a way of running their program without the ACTION! cart.

Q: Why do I have to re-compile the program every time I want to use it?

A: DOS II's menu program destroys the R: and T: device drivers, so you can't use the "L" menu option to run a pre-compiled ACTION program that depends on the R: or T: drivers.

If you are clever, you can append the ACTION! object code to the AUTORUN.SYS file to generate an auto-booting version of KERMIT.

If you have OS/A+, you can, indeed, save the compiled version of Kermit and execute it from the command line. Just make sure that you have loaded a device driver first!

I don't have kermit for the Atari, but I would like it.
Please include me in the distribution if it anyone has it.

-
     Since there has been some interest in finding the book, De Re Atari, I thought that I would mention where I saw a couple of copies of it for sale. Last night, March 25, I was at Computer Literacy ato pick up a copy of some magizine. I saw two copies of De Re Atari there. They probably will not last long, so you had better hurry if you want one.
     By the way Computer Literacy is the largest computer book store that I have seen. In ten minutes there I found five books that I wanted to buy. Now if computer books were not so expensive; one of the ones that I was looking at cost $76.00! The store hours are; M-F 9:30 AM to 8 PM and Sat. 10:00 AM to 6:00 PM. They are at 520 Lawrence Expressway, Sunnyvale, Calif. 94086, between Central Expressway and highway 101. Their phone number is (408)-730-9955.

      I just recieved a copy of CHAMELEON TERMINAL EMULATOR from APX.
It is a neat program. It's worth the money and a lot more.
There are only a few questions about it.
         1) the files downloaded with the XMODEM protocol will not run
                    neither using the L command from DOS II, nor from
                    BASIC (run "D:FN"). That goes for both OBJECT file and
                    BASIC source files! Is there anything that I'm not setting
                    right?
         2) although there is VT-52, VT-52XL and ADM3a emulation, I had
                    not been able
                    to do full screen editing. Is it possible at all?
                    If not, why is it included?

3) when I talk to ATARI BBS , how do I set the ATASCII option?
(I have the 835 direct connect modem without the 850 inter-
fase)
4) also, no matter what I set, I was not able to scroll up and down!
and I have ATARI 800 with 48K, which should give me
up to 9 pages!

Thanks in advance for any information.

I'm looking for public domain software to do the following:

1) is there anything that allows you to "PRESS THE START BOTTON" and
have a picture dumped to an EPSON FX80?
2) good drawing programs?
3) an R: driver?

thanks for your info...

this is from the compuserve atari subgroup, where Antic magazine posts
their latest news...

The ST series is apparently on time, with small quantities available
in April sometime, and full production in June. Early in March, Atari
demoed production versions of the ST, so this may very well be true.
Digital Research, in a separate news conference showed GEM running on
the ST, the IBM PC, and various clones. Stay tuned.
     Mike

re: chameleon terminal emulator
     I do not have the new 4.2 version, only an old one,
but would be interested in upgrading it. On my version, scrolling
up and down is accomplished with the select key, and full screen
editing works fine in the vt52 mode when you do a setenv TERM vt52
and a ts vt52.

[Give 'em Hell, Jack!]

I've been told that a back issue of Antic or Analog has plans for a
RS-232 to joystick connector interface. Does anyone out there
know which issue? Anybody built one?

Thanks for any help.

    I did not mean to infer that it couldn't be done, only that it
could not be as complex as the version that I use on that Unix machine
that it runs on where I work.

>$400!!. Also, the 3.5" (8.7 cm) floppy, 250K, will be $100. The 500K double
>sided will be $150!!! A spec sheet on the ST implied that both BASIC and LOGO
>are resident. Sales are to start mid April (just in time for Trenton!).
>But only "package deals";a fully populated machine, monochrome mon, and floppy
>for about 800 Georges. This will bring the Amega to market in short order.

I wouldn't bank on any of this information. In every reference I've heard
that's at all close to actual Atari statements, there have been disclaimers
to the effect that pricing is not fixed yet. In addition, most analysts
think that while Atari has announced mid April shipments, they are not
expecting them until sometime later. One thing I did hear though, is that
Atari is even now shipping to specific software developers at a cost somewhere
near $5000.00, can anyone verify this?

The spec sheet I read indicated that both BASIC and LOGO will be available,
but not necessarily resident. A similar rumor I heard (that I later heard
dispelled) was that with Atari's DOS you get a macro assembler and C compiler
as part of the package.

Where did you get this information? Certainly citing the source might help
in judging the accuracy of this information.

    I recently posted an article stating that I had an operational
version of rogue5.2 on my atari w/ 48k and 1 drive. After reading follow
up messages referring to Epyx's possible release of rogue, I am skeptical
that they will do so. The version I have would be very acceptable for
marketing if I fix a few bugs which it still has. The only real problem
is copyright infringement caused by publication w/o the author's consent,
and if you persons (Ken Arnold, Michael Toy...) who are responsible for
this great game would make some communication to me on the subject, then

whether Epyx has a version or not, there just might be one published anyway.

-Peter Williams
tektronix!reed!peterw

P.S. I would be interested in what the demand for such a game would be, and what price would you consider reasonable for a good implementation. (Sorry, I could not do anything about the 40 column screen.)

A few weeks ago, I announced the availability of RDBMS/AT, a relational database system in Atari BASIC. At that time it was only available on DOS 3 disks. With the help of my 1010 cassette recorder, I've ported RDBMS/AT to DOS 2 disks, and I'm again announcing the availability of the software.

After sending out a number of DOS 3 disks, I discovered that two modules were partly missing (BLDRDBMS.V1 and RDBMS2.V1); I had the Atariwriter driver for the Gemini 10X loaded at the time I made my master DOS 3 disk, and there was not enough room in memory for all of the code in those two modules. I apologize for this mistake, and in making my DOS 2 masters, I have doubled checked that each module is intact. Two DOS 2 disks are required, one for code and one for documentation.

The following information is a repeat of the description given out earlier.

****

The database manager is called RDBMS/AT and provides the following

functions:

1. A standalone builder program written in Atari BASIC to build the database. You can have as many fields in each record as you want, and the length of each field can be as long as you want. The fields can be either REAL or CHARACTER values. You can have as many records in each relation as you want, and you can also have as many separate relations as you want, limited only by the memory available.

2. Six subroutines that can be included in the source of application programs. These routines provide a "user view" of the database.

   (a) Obtain ADEF Table. The ADEF (A DEFinition) table is used by the standalone program to build the database. Your application program uses this subroutine to learn the characteristics of the database.

   (b) Get a New Record with Default Values. Your application program uses this subroutine to obtain a new record from the database manager. The fields in the record contain default values as specified by the ADEF table. Your program places new values in the fields.

   (c) Insert a Record into the Database. Your application program uses this subroutine to request that the manager place the record in the specified relation.

   (d) Select a Record from the Database. Your application program uses this subroutine to obtain a record from the specified relation.

   (e) Update a Record in the Database. Your application program uses this subroutine to change values in a record in the specified relation. The manager obtains the record from the database, updates the values, and returns the record to the database.

   (f) Delete a Record from the Database. Your application program uses this subroutine to remove a record from the specified relation.

3. Various routines to support the linked lists that comprise the database and perform the disk I/O. These routines provide a "physical view" of the database.

The DOS 2 program diskette contains the following files:

1. BLDRDBMS.V1 The builder program

2. RDBMS1.V1 A template for an application program that contains the proper interface for RDBMS/AT.

3. RDBMS2.V1 The subroutines comprising the "user view".

4. RDBMS3.V1 The subroutines comprising the "physical view".

The source code contains many comments to help you understand the code. The comments do not have BASIC line numbers and are thus thrown away when the code is loaded into memory.

The DOS 2 documentation diskette contains the following files:

RDBMS0.DOC thru RDBMS5.DOC	The users manual, formatted by Atariwriter for the Gemini 10X printer. The manual contains 25 double spaced pages.

This version of RDBMS/AT should be thought of as a prototype version to gain functionality. I've made no attempt to optimize the program in any way. As a result, the program takes up 15,683 bytes in memory leaving only 10,185 bytes (48K 800) for your application program. However, I feel it is a very useful tool and can be the basis of some powerful application programs.

People who obtain RDBMS/AT are welcome and encouraged to modify and expand the code and to convert it to other languages. There are only two restrictions that I impose. First, that your version contain an edit history containing the author's name and version number of EACH proceeding version back to my original version which is V1.0. This edit history must be in both the users manual and each source file. I feel that all persons involved with public domain programs should be given credit for their work. Second, that NO versions of RDBMS/AT be used in ANY way for commercial purposes. Public domain programs should remain free for all to use and enjoy.

If you would like a copy of RDBMS/AT, send me two DOS 2 formatted diskettes and a SASE.

> I wrote a version of rogue ... 6502 machine lang.

Um .. for what machine? You wouldn't be interested in selling it (is that
legal ?) for a , um, nominal cost so that we can, um, get some work done,
would you ?

BTW, does anyone know how or if one can get the Tech. Ref. Manual (ATARI).
(& the 1200XL supplement) -- I haven't yet managed to get through to ATARI.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***

 Does anybody out there know anything about the "Deep Blue C" compiler for the Atari 800? It has just become available again afer an absence of several months. My questions are:

   1) Is it XL compatible?
   2) How efficient is the code it produces?
   3) How large a subset of the C language does it implement?
   4) What facilities does it provide for interaction with the
       Atari's special capabilities (various graphics types, etc.)

 Also available is a "Mathlib" package for Deep Blue C; information on this would also be greatly appreciated.

 Please reply directly to me; I will summarize to the net if there is enough interest.

                                Craig Berry

hello there.....
     I had no idea anyone was working on a rogue for the
atari, or any of the pcs for that matter. This would be something
to rival Zork and friends. In any case, I would love to get ahold
of it....Send me a note with ransom demands or maybe we could xchg
for things I have already bought.
          Thnx
          Mike

[//]

I put the kermit distribution up on sigatari on compuserve. Also,
a binary version (i.e. no Action! cartridge required,) is
up there, but if you have the Action rom you would be better off
with the source.

It is also available from a dec marketing bbs- search through old
net.micro.atari fo the number.

It works quite well, but is a LIMITED subset of kermit. Someone should
add some features, like remote server capabilities.

If you don't have access to CIS, send me some mail. If I get enough
response I'll put it on the net.

Development systems are available for $4,500, they come with
a C compiler, a macro assembler, GEM (but no toolkit,) and
the TOS. This is supposedly a hand built 512K system.
          source- CIS online conference with Trameil and sons.

sigatari claims that units will ship first week of april- the
bundled system mentioned previously. I don't think that there
was any mention of a C compiler or and assembler.

I think that when you can put down 600 credits at KMart, and pick
up an ST, then they will have shipped.

I have an Atari 400 with 48K, a Trak AT-D2 disk drive with printer port
and 4K buffer connected to an Epson MX-80 printer. The problem is when
printing large files, large portions of the files are lost. It seems as
if the 4K buffer in the Trak gets filled the Atari does not stop sending
data to the Trak. Small files, < 4K, print with no problem. I believe I have
all the DIP switches in the Epson and on the back of the Trak set properly.
Has anyone had a problem like this? I am hoping it is a setup problem not
a problem with the printer interface in the Trak.

Does anyone know of an emulator for the 1030 and/or 835 Atari modems
that emulates a VT52 or VT100 series. Does it have 80 columns? Is it
public domain? Where can I get it? Is it written in BASIC? 6502? etc..

              I would sure appreciate it!

    If you were to write a program on the ATARI to handle floating point
numbers and strings (possibly arrays of chars), which language would you use?

                        curious, Alex Kriger.

Just recently I purchased CHAMELEON terminal emulator from APX through ANTIC
 magazine. So far I do not have too many comlaints (you make look a few notes
back for some of my complaints) but it emulates VT52, VT52xl, ADM3, GLASS TTY
and a test terminal. It has a capability of using 40, 80 and 132 columns,
BUT! you can only see 40 columns! (you have a window that can be moved
left and write 40 columns at a time. You do not need the 850 to upload and
download. That is why I was really happy about it! (for problems look back)
I use it with my 835. The first thing you see is a menu that lets you
pick which device you are going to use.

I wrote a version of rogue 5.2 w/52 monsters and more armor/weapons/stuff,
and it fit (tightly) on one sssd disk. I wrote it in 6502 assembly, and
with a little disk action for the map generator, and the not-so-often used
strings, it worked fine. I even had about 3-4k left over for other stuff I
might add.

ANTIC Magazine Software Catalog

The following are programs that were formerly available from APX:

Cat #	Title	Price	Description
AP101	SPACE WAR	$15.95	A two player galactic shoot-out. ML.
AP102	CRIBBAGE	$12.95	One player game against the computer. An APX winner. BASIC with ML sub-routines.
AP103	LORD OF THE ORB	$15.95	New. Explore three vertically scrolling levels. ML.
AP104	SARATOGA	$15.95	An American Revolutionary War Simulation. APX winner. ML.
AP105	SNARK HUNT	$15.95	An underwater game. Up to 8 players can attempt the mission. An APX winner. BASIC with ML sub-routines.
AP106	STOCK MANAGEMENT	$19.95	An APX winner written in BASIC with ML sub-routines.
AP107	DIGGERBONK	$15.95	A one player vertical scrolling maze. ML.
AP108	DRAWIT	$19.95	An outstanding drawing program features

16 colors with 8 hues, automatic fill, 2 zoom levels, page wipes and an animator. ML.

AP109 BURGERS! $15.95 Designed for young children. Has light and spritely music. ML.

AP110 GALAHAD AND THE HOLY GRAIL $15.95 Graphics adventure. One of APX's all time best sellers. This and BURGERS! was written by Doug Crockford, one of Lucasfilm's top game programmers. ML.

AP111 DOG DAZE DELUXE $15.95 One or two player game with 3-D effects are said to be excellent. ML.

AP112 BUMPOMOV'S DOGS $15.95 A two player game featuring splitting/ recombining screen. ML.

AP113 CHAMELEON CRT TERMINAL EMULATOR $19.95 VERSION 4.2. Convert your Atari into a computer terminal. For five types, "Glass TTY", ADM-3A, DEC VT-52, IBM 3031 ASCII and a Test terminal, CHAMELEON supports most-used features (including Kermit protocol). The wide-screen 80-column emulation (displays 40 columns at a time with auto horizontal scrolling). Use with UNIX operating systems. All terminal characteristics are user-definable. Supports the Atari 835 & 1035 modems and now has autodial capability (for 16 phone numbers). CHAMELEON is now totally compatible with AMODEM. ML.

AP114 DEEP BLUE C COMPILER $19.95 This is a proper subset of version 7 C, which means that programs written for it will run almost without change on computers supporting the full language. Written in C, requires a non-line oriented text editor.

AP115 DEEP BLUE SECRETS $19.95 Source code for AP114. Requires AP114, Atari Macro Assembler and a non-line oriented text editor.

AP116 DANDY $15.95 A 26 level dungeon adventure game that features cooperation. Up to four people can play at once with separate joy sticks. Good family game. ML.

AP117 INSTEDIT $19.95 A character set editor that helps you make maximum use of the advanced

graphics capabilities of your Atari.
BASIC with ML subroutines.

AP118 CUSTOM BLEND $19.95 It gives you the power to create any combination of text and graphics modes--even Display List Interrupts-- automatically. ML.

Note: ML means written in machine language. BASIC means it is written in BASIC and requires the BASIC cartridge (on the 400 & 800).

ANTIC also is selling the PAPIE Disks. These 8 disks contain subroutines and utilities from the best of the Atari programmers including Russ Wetmore (Preppie I & II), Clinton Parker (creator of ACTION! and fellow netter), Jim Nangano (Flip & Flop), Sheldon Leemon, Jerry White and many others. These are of interest only to advanced programmers probably, but you get full disks for $12.95 or all 8 for $79.95.

There is also a listing of all the public domain disks that have been available from ANTIC for some time now.

There is a shipping and handling charge of $3.00 for each disk order, provided the order is for 10 disks or less and $3.00 for each book ordered. These can be ordered toll free at 800-227-1617 ext. 133 or by mail from : ANTIC Publishing
524 Second St.
San Francisco, CA. 94107

I'll update this catalog as it changes and post it every few months.

ANTIC Magazine Software Catalog

The following are programs that were formerly available from APX:

Cat #	Title	Price	Description
AP101	SPACE WAR	$15.95	A two player galactic shoot-out. ML.
AP102	CRIBBAGE	$12.95	One player game against the computer. An APX winner. BASIC with ML sub-routines.
AP103	LORD OF THE ORB	$15.95	New. Explore three vertically scrolling levels. ML.
AP104	SARATOGA	$15.95	An American Revolutionary War Simulation. APX winner. ML.
AP105	SNARK HUNT	$15.95	An underwater game. Up to 8 players can attempt the mission. An APX winner. BASIC with ML sub-routines.
AP106	STOCK MANAGEMENT	$19.95	An APX winner written in BASIC with ML sub-routines.
AP107	DIGGERBONK	$15.95	A one player vertical scrolling maze. ML.
AP108	DRAWIT	$19.95	An outstanding drawing program features 16 colors with 8 hues, automatic fill, 2 zoom levels, page wipes and an animator. ML.
AP109	BURGERS!	$15.95	Designed for young children. Has light and spritely music. ML.
AP110	GALAHAD AND THE HOLY GRAIL	$15.95	Graphics adventure. One of APX's all time best sellers. This and BURGERS! was written by Doug Crockford, one of Lucasfilm's top game programmers. ML.
AP111	DOG DAZE DELUXE	$15.95	One or two player game with 3-D effects are said to be excellent. ML.
AP112	BUMPOMOV'S DOGS	$15.95	A two player game featuring splitting/ recombining screen. ML.
AP113	CHAMELEON CRT TERMINAL EMULATOR	$19.95	VERSION 4.2. Convert your Atari into a computer terminal. For five types,

			"Glass TTY", ADM-3A, DEC VT-52, IBM 3031 ASCII and a Test terminal, CHAM-ELEON supports most-used features (including Kermit protocol). The wide-screen 80-column emulation (displays 40 columns at a time with auto hori-zontal scrolling). Use with UNIX operating systems. All terminal characteristics are user-definable. Supports the Atari 835 & 1035 modems and now has autodial capability (for 16 phone numbers). CHAMELEON is now totally compatible with AMODEM. ML.
AP114	DEEP BLUE C COMPILER	$19.95	This is a proper subset of version 7 C, which means that programs written for it will run almost without change on computers supporting the full language. Written in C, requires a non-line oriented text editor.
AP115	DEEP BLUE SECRETS	$19.95	Source code for AP114. Requires AP114, Atari Macro Assembler and a non-line oriented text editor.
AP116	DANDY	$15.95	A 26 level dungeon adventure game that features cooperation. Up to four people can play at once with separate joy sticks. Good family game. ML.
AP117	INSTEDIT	$19.95	A character set editor that helps you make maximum use of the advanced graphics capabilities of your Atari. BASIC with ML subroutines.
AP118	CUSTOM BLEND	$19.95	It gives you the power to create any combination of text and graphics modes--even Display List Interrupts--automatically. ML.

Note: ML means written in machine language. BASIC means it is written in BASIC and requires the BASIC cartridge (on the 400 & 800).

Summary:

>Atari has another machine in the
>works using the (rumored) 32032 that would bring the equivalent
>of a sun workstation to the home. If that really happened
>the entire micro market would be thrown into confusion.

the 32032 is not rumoured. I have touched them, held them, played with them and used them here at National. Whether or not Atari is using them is still a rumour, of course, but the chip exists.

chuq (*how's that for now saying anything?*)

Well, Atari has kept one of their promises since Jack Tramiel took over.
Check your newsstands/bookstores for the magazine ATARI EXPLORER...this
is the updated and much improved successor to the ATARI CONNECTION, published
by Atari for their users.

The tone and audience of explorer is much the same as the Atari connection,
however, the layout and graphics are really slick and much improved. The
magazine is published bimonthly (6 times a year), whereas, I believe, the
Atari Connection was seasonal (4 times a year). Price is $3.00. At least
for this issue, it's worth it!

What's inside...

     The most striking thing about this issue is definitely the
9 page center spread describing (PICTURES AND ALL!!) the new Atari
machines. It looks like this will be their advertisement for
other mags, and it is a beauty. The first page has a dramatic
"Atari Proudly Presents", and the following pages very graphically
detail the ST line of machines. Full specs and feature details
are given. The last page has what will no doubt be Atari's
slogan..."Power Without the Price".

8-bit machine owners need not feel left out...there's an article
(with a picture of the 65XE) entitled "The new 8-Bit Products".
The article basically rehashes the specs that have been outlined
both here (in the CES reports) and in other mags.

Other features in the Mag:

"The Atari Commitment" - An introduction to the new management at Atari
"Atari Computers at NASA Users group" - What it says
"Telecomputing" - Intro to BBSs and the like (Compuserve, etc).

Departments:

Editorial - explains the magazine changes
Industry News - including article on the MIDI music interface
Letters
User Friendly - A column about (and by) various user groups. A.C.E., this month
Education - A column about the Atari in education
Games - Excerpts from "The Art of Computer Game Design" by Chris Crawford
     (kind of ironic, isn't it!)
Computer Classroom - Part II of intro to ML programming
Logo Notions - Manager for LOGO work space
Bits & Pieces - The "practical" short programs
Kinetic Graphic Art - yet another graphics demo
Product Reviews - Track & Field, Millipede, and the book "Moonlighting
     with your computer"
Dr. Wackos Word Processor - An excerpt from the book of almost the same
     name.

Nice going, Atari!

Considering that Tektronix can't seem to get ahold of enough (any?)
fully operational 32032's to put their '032-based workstation into
production, and Tek is arguably National's best 32xxx account, I would
suggest that "existence" is a relative term.

(I had better add the "not my employer's opinion" disclaimer).

I neglected to mention, the Atari has a '4-color' character mode. In
this mode, 40x24 character cells of 4x8 4-color characters are presented.
With the proper construction of 'mosaic' characters, multi-screen backgrounds
can be constructed which take up no more than 960 bytes each. Scrolling

can be performed as usual in this mode, and with the use of display list and/or vertical interrupts, character sets can be switched to facilitate a more extended 'mosaic' set to work with, or to facilitate character set based animation.

The game 'Spelunker' is one of my more favorite examples of character set animation and is mixed with scrolling and player-missile graphics. The game background is peppered with little animations, Power packs undulate, little puffs of smoke pop up in various places, extra-life prizes rotate, sections of the terrain bounce up and down, vertical 'lifts' scroll up and down. With this type of animation, the use of these little movements are not any more costly if you have a screenful of them than if you only have one thing going on. I get the impression that a high percentage of the better Atari games use this mode. The list includes games such as Ali Baba and Return of Heracles, Miner 2049er, Shamus I & II, Zeppelin, Necromancer, Montezuma's Revenge, Seven Cities of Gold, Murder on the Zinderneuf, Gateway to Apshai, Lode Runner, Pharoah's Curse. I'm guessing on these, by the way, I don't know what they're actually using, but they LOOK like they are probably using the 4-color character mode, in addition to other effects.

Can the Commodore perform 'like' functions? I would expect it can, as I think some of the above-mentioned games are available for it. Is the resolution the same?

On the subject of sound, what capabilities does the Commodore have for generating different wave-shapes? The Atari is limited to 1 pure tone, and 7 noise tones. No sawtooth, squarewave, or programmable wave shapes. Some filtering, but rudimentary I think (haven't fully explored this). However, I am continually amazed by what some people have been able to do with what little there is.

OK OK OK

I have c64 and I think that it and the atari are
fairly similar although i give the edge to the 64 especially
since it is STILL a very popular machine and I think the
best in terms of both expansion and software is yet to come.

The comparision that everyone is missing, however is PRIIICE!!!
When I decided to buy a computer (the vic20 was out) the main
choices were between the apple 2 line and the atari 800 (the
400 was not even a cinsideration).

What did I face the apple for well over $1200 or the atari 800
at around $800. Yes, thats right. Lets not forget that when
CBM introduced the 64K c64 the 48K apples and ataris were
selling at the above prices.

Is it any wonder that it became so popular???

It was only after the 64 became fairly established that
atari and apple started coming out with their own
64K machines and then the famous price wars started.
Bt then, however, Commodore was already well on the way to
becoming king of the hill.

By the way the TI99/4a at the time was still pretty close
to a thousand dollars.

No matter what you like or dislike about the 64 lets give
credit where credit is due. Before it became available
apple and atari were charging twice as much for machines
that were at best very similar to the 64 and at worst
somewhat inferior.

I prsonally say thanks Commodore for giving me an affordable
alternative and for making everybody improve their computers
while lowering their prices.

If anyone disagrees I'd sure like to know why

[]
>Commodore use their own video controller.
>Interrupts are a major feature in the video (raster,collision etc.)

not always necessary in the Atari except for basic vertical interrupt,
however other interrupts are available, and can be quite useful.

>There is collision checking,(background and foreground plus a possible
>foreground colour that is transparent for collisions).

Ditto Atari

>The sound chip (SID) has a (maybe more) 4 bit D to A output also.

Ditto Atari, however, display interrupts (including the vertical
required for basic display) will affect associated timing loops
when using this feature.

>It also has an input that gets filtered if you desire (i.e. tape).

Not sure about that on the Atari.

>I have had 48 24*21 sprites on the screen at the same time.

You could have 120 8*8 sprites, or 24 20*8, or 96 10*8 or....etc.
(odd sizes are possible) but not without some restrictions. I
would imagine the C64 would have some restrictions at these resolutions.

>The c64 has three Forth compilers available at my last count, plus
>one full Pascal implementation.

The Atari has AT LEAST 3 Forth compilers available, several of them
are public domain, At least 1 Pascal and at least 2 C's. Several

Macro Assemblers, Logo, Pilot, A Basic compiler, Lisp, etc. etc. etc...

>   Dave.

>you could change video modes on every line also.
>This uses a lot of main processor time if used in many screen locations
>but can be used to give many effects not available using the display
>file on an Atari,for example a one line pixel scrolling message anywhere
>on the screen.

This is performed in almost exactly the same manner on the Atari. The
display list is a table of instructions for the display controller that
indicate what graphics (or text) mode is being displayed, and where the
data is coming from in memory. Each mode takes up some number of raster
lines, and at the end of that mode, a new display instruction is fetched
to determine what the next mode is. For example, the first display list

instruction can indicate a 2 color charater mode, starting from some
memory address. This mode would take up 8 raster lines. The next display
list instruction could specify a graphics mode that takes up a single
raster line. then another character mode, or several line graphics mode
line could be implemented. Scrolling can take place merely by modifying
the display-list table's address pointer to the data for the specific line.
A display list instruction has a bit to signify an interrupt on a given
mode line. The processor can then modify the color tables, move the pointer
to the character set data, move a players (sprites) horizontal location,
or some combinations thereof, and probably a few useful things I haven't
thought of. Interrupts are not required for scrolling, but the main
vertical interrupt is required as it sets up the initial pointer to the
display list table itself. Multiple display list tables can be kept
in memory, so vertical interrupt routines can alternate or 'page-flip'
or whatever very simply.

>The disk interface speed in now effectively cured, with small
>alternative loaders. It now takes about 20sec to load 32k instead of
>1min30sec that it takes normally, since Atari use serial interfacing
>as well, I would assume that their disk speed is slower than this.

I wouldn't assume this, but I haven't timed it.

>As for memory, I can't compare the XL machines with the c64 since
>I'm not sure of the facts, but almost all commercial software is capable
>of access to the entire 64k of memory.

With the Atari, access to the entire 64k is available, but many applications
may not use it as it may eliminate a large part of their market which may
be in the 48k 800's out there.

>Sound, the Atari relies on fixed oscillators with which one can only
>make beeping noises (directly), the c64 has a synth which does more
>than most other people mentioned. For a start you have a choice of wave-
>form on all voices, this is for harmonic control. Triangle waves produce
>the least harmonics and sound more like most wind instruments,
>Sawtooth are very quite high up in harmonics, and pulse wave forms
>are like most other micro beeps except you can change the step/mark
>ratio. Finally there is the white noise generator, this is just another
>optional wave form, so can be used on all voices(unlike what others
>said). Next are the filters, there are digitally controlled
>high,low and band pass filters which can be used to make tinny
>sounds or bass sounds or whatever. Other features include
>ring modulation, hard sync., envelope shaping, A to D converter
>on voice 3, plus much more. I have heard very good speach synthesis
>on the c64 with no extra hard-ware(it really sounds like a person.)

In general, the C64 sounds like it has better sound generation characteristics,
however there is a very good software-only speech synthesizer that sounds
quite good that runs on the Atari.

>Graphics are next, the Atari highest mode is higher than that of
>the c64 I think, but what makes graphics in games is colour.

>The Atari is lousy at having a good range of colour on the screen
>at once, with careful planning on a c64 there is no reason
>why you can't use all 16 colours where you want when you want them,
>i.e. no trouble getting more than 2 colours on one raster line.

WRONG, you can get all 128 Atari colors on the screen at the same time.
There are modes that allow 16 colors, or 16 shades of 1 color, and with
display list interrupts, the entire color table can be modified at each
display mode line. Color range is NOT a problem with the atari.

>The Atari sprites appear to be very limited too, why would one
>want a sprite filling the whole screen? Admittedly there are only
>8 sprites on the c64, but with the raster interrupts running
>then any number can be used, and they CAN move in both directions.

Rarely is a single 'sprite' used filling the whole screen. Using display-list
interrupts, a single 'sprite' vertical stripe, can be divided up into many
individual ones. (up to 192) with different horizontal positions. Granted
vertical movement takes a byte move of the sprite data, but many times this
is not a lot of data, and can be done quickly. With 4 vertical 'players'
(Atari's name for sprites) and 4 vertical 'missiles' (Atari's name for
2 bit wide sprites, can be combined to make a 5'th 8 bit wide player) this
adds up to a fair amount of graphics power.

>Software, this is where my favorite machine starts looking a
>little low, unfortunately where there are the same games on both
>the Atari and the c64 the c64 looks worse off, I can see no real
>reason why this is so, but I can only guess by saying that all of it
>was originally written on the Atari and then made to work on the c64.
>Thus when it designed all the graphics etc. were made to fit the Atari
>in particular and it was hard to move. Where software was made for
>the c64 (see Impossible Mission or Space Taxi) the quality is the
>best.

>In the case of support all I can say is that in England, where I live,
>Atari seems to have vanished, and there appears to be no support whatever
>despite all the Net News saying the 800XL is only about $120 over in
>America.

I must admit, even here in the U.S. (L.A. to be exact) support for Ataris
has kind of dried up. You used to be able to see Atari's for sale in the
computer stores, with all the associated support. However, this was back
when the 800's were selling for $600+. Now the main source for Ataris is
toy stores and discount houses. Up to date software supply is growing thin,
as the computer stores prefer the larger profit margin of IBM and Apple
wares. This may be a phenomenon we all have to live with, and perhaps resort
to mail order if all else fails. One hope, at least to Atari, would be the
success of their new 68000 product, which may re-inspire some stores to
carry the complete Atari line. I hope so. And/or perhaps the Amiga will
have a similar effect for C64 owners.

[munch, munch... is this bug dead yet?]

Hmm... those prices seem a little off. True, people have been heavily discounting the Mac to get it to sell; this probably won't happen to the new Atari machines (at least not initially). Comparing a discounted price with manufacture's list is normally unfair, but we can probably accept it in this case.

However, comparing discounted prices on Macs with *inflated estimates* of Atari's announced prices is going too far. The *announced* price of the base system with 128k (same as the Mac) is $400. The *announced* price of the disk drive was $100 (!), and most people will initially opt for an RF modulator ($25) and their TV set rather than spending money on a high-res display. The total system price for a Mac is $1400 minimum; the price for an equivalent Atari is $525. Comparing fully-expanded systems is even more fun; $2400 for the Mac versus $725 for the high-end Atari system, or a factor of three difference in favor of the Atari machines. They also offer color, something you won't be seeing on the Macs for a while (and when you do, it'll cost almost as much as their memory upgrade for all the same reasons). Add to that the promise of lower-priced software and peripherals, and I wouldn't be at all surprised if the new machines blow the Mac out of the water.

WARNING: The prices quoted above for the Atari machines are *announced* prices; if you remember how the Macintoshes jumped in price by the time they became available, it's worth taking Atari's prices with a large grain of salt.

In many ways, Atari's prices are amazingly low... maybe too low.
I'll wait and see, but likely won't buy until the smoke clears.

Remember, Atari doesn't have Cabbage Patch Dolls to fall back on...

******

Here's my 2 cents concerning the Atari 800's graphics capabilities (the
800 and the 800XL use the same graphics hardware, I believe):

1. Any of the Atari's 16, or so, graphics modes can be mixed on the screen
simultaneously--the only restriction is that a single graphics mode must
extend from the left edge of the screen to the right. Some modes use a single
scan line, while others use multiple scan lines. In other words, it is
simple to mix text and high res graphics on the Atari's screen in different
orders. It is useful to think of these graphics modes as layers--some are
thicker than others, and they can be stacked on top of one another in any
order.

2. For each "layer" you can supply an address where the data for that layer
resides. So it is simple to have different parts of the screen's data in
different parts of memory. It is also possible, simply by changing the
address (WITHOUT MOVING A SINGLE BYTE OF DATA) to map different data to a
specific layer. If, for example, you add 1 to the address, that layer will
appear to scroll to the left by 8 pixels. Because screen data need not

reside in contiguous RAM, it is simple to define more data than will actually fit on the screen in a layer--and then by manipulating this single address you can scroll over the previously unseen data. If you do this for multiple layers that together describe some scenery, you can scroll past colorful scenery with almost no processor overhead!!

3. Since manipulating this address (its called the Load Memory Scan Address, or LMS) causes the scenery to "coarse" scroll by 8 pixels, there is another bit that can be use to cause the data to "fine" scroll by a single pixel. By combining 7 fine scrolls with a single "coarse" scroll, you can scroll smoothly over your "scenery".

4. Of course, the same mechanism can be used to scroll vertically--again with almost no processor overhead.

5. Although the Atari has only 5 color registers, it can be made to display many more colors. For each layer, you can instruct the computer to vector to the Display List Interrupt handler (DLI) of your choice. If you want the top half of the display to be blues and greens, but the bottom half to be yellows and reds, all you need is a DLI routine at the layer before you want the change to occur. The actual code will be approx. 5 lines. Of course, if you have lots of DLIs you could have lots of colors.

6. In addition to all of this "background" graphics stuff, you have "Player-Missile Graphics". These are like the C64's sprites, but probably not as powerful. They support all the usual collisions between players, other players, missiles, different background colors, etc. They can be 8 pixels wide (or bigger if you "stretch" them) and as tall as you like. They are only a single color, so if you need more than one color you must put 2 players on top of one another and move them in unison. Although there are only 4 players and 4 missiles, it is possible using DLIs and other stuff to make it look like there are lots more. This is not as easy as some of the othere techniques, but is successfully used in lots of atari games--like the one where the screen looks like a shooting gallery.

7. Two of the 16 graphics modes are of special interest. In addition to the regular character set (which by the way is easily bypassed and replaced with the character set of your choice, say, if you would prefer to see hebrew or greek characters appear on your screen), there are two "mosaic", multi-color character sets. You can define your own characters and each character can have 4 colors in it. These are really useful if you would like to define alot of "scenery" but you don't want to use up the large amount of RAM that high res requires. These characters give the same effect as high res, but whenever you want to repeat a pattern you reuse a previously defined character. Suppose there is some blue sky and some green grass in your scenery--using these modes you would only need 2 characters to display those parts of the scene. A few dozen more to describe the details of, say, the car, the person, and the house, and you are all set.

To sum up, using these techniques, it is pretty straightforward to create a busy screen that scrolls over a picturesque graphical scene that

is many times taller and wider than the viewport, with a stock market
ticker tape horizontally scrolling quickly past near the top.
You could have a few special purpose cursor running around the screen
controlled by joysticks. The whole thing might comfortably involve 20
or so colors on the screen simultaneously. Additionally, you could
instantly switch from this screen layout to a drastically different one
and back again.

A good example of all these techniques is the game "Eastern Front" which
is a war game that repeats the battle between the Germans and the Russians
along Germany's eastern front. The map of Europe is 4 times as wide as the
screen and 3 times as high. There are trees and rivers, Russian and German
troop markers, special purpose cursors, status lines with ascii text, and
changes of season that include color changes. Its pretty spectacular, and
the whole thing fits into 16K.

All this from an OLD box that sells for approx. $200.00 isn't bad.

[.........]
I've recently read some Usenet articles expressing some doubt about
Atari's ability to produce these new claimed 16 bit products, i.e.
68000 with GEM for $399 etc. While they may be sticking their neck
out, I think many of us should HOPE they succeed. Otherwise, we'll
probably be looking at that 8086 family junk for the rest of our lives.

I think that both Motorola and Digital Research probably have a fair size stake in this matter. In order to capture a bigger piece of the 3rd party software market, they both benifit from a standardized operating system that is transportable to various 68000 based machines. Certainly Apple is not offering this with their Mac, (try running MacPaint or MacWhatever off the shelf on anything but an Apple product!). Software developers want to see an applications environment that provides object-code transportability to a variety of machines from different manufacturers. Right now, that means IBM and clones.

I certainly hope Atari succeeds, as the new products may finally establish an environment on the 68000 that is more condusive to applications growth.

Rather than take the 'It'll be a cold day in hell...' attitude about the new Atari (which may amount to saying 'It'll be a cold day in hell when you can find any 68000 generic applications'), I'd rather wish them luck and hope that their cutthroat marketing approach has the desired effect of establishing the 68000 de-facto standard.

Keith says that we may have to resort to mail order software as if it was a last resort. Actually, I prefer to deal with mail order houses because they seem to CARE about Atari and Atari owners. I agree that it is (or could be) a pain to have to send software back if it doesn't work but I have only had to do that once. 'Spy vs Spy' didn't load when I first got it but I had send in the warranty card already, so I sent it back to

FirstStar directly with a detailed letter. It was packed carefully and marked magnetic, do not X-ray, etc. When I got back my new copy, it was in a large envelope with no warning and no letter of any kind. To be fair, the package it is sold in is very sturdy and protects the disk very good.

I deal mostly with Software Unlimited (Disk of the Month Club) and Software Discounters of America. Both are excellent and I usually have the software in a week to 10 days from mailing my order. I say 'give the business to the person that wants it the most'. The prices are usually a lot better than I see locally and the shipping vs local tax is pretty close to a trade-off.

According to the new ANTIC magazine, De Re Atari is no longer available. They recommend the book 'Advanced Programming Techniques for the Atari' by Linda Schreiber. It is available from TAB books and is close to De Re Atari and is much clearer.

[]
Computer Systems News for this week indicates that Atari, Commodore,
ACT, and Apricot (ACT USA) have all signed up for GEM. Moreover,
GEM and Concurrent DOS are being readied, the article continues, for
licensing by anybody for about anything. [Shades of Unix?]
     The story then says Atari's business machine will be based upon
the 68020. This is the first public reference I have seen on this,
and it is stated quite positively. Considering the previous press items
suggesting it would be Series 32000 based, it looks like the rumor mills
are about balanced between the two, now.

The poke address that you mention controls the Direct Memory Access
of the graphics processor, ANTIC. Poking a 0 to this address turns
off the ANTIC processor and thus the screen goes black. There is
another value to poke to this address to turn the screen back on
but since I don't have my reference manual handy, you'll either
have to look in a manual (if you have one) or examine the program
listing for another poke to 559 (which may have been accidently
left out of the listing and is why your program won't work).
The purpose of turning off the screen is that when you redefine
the character set, the screen becomes rather messy during this
redefinition process, and a black screen is better than a messy
screen. You can leave the poke 559,0 out if you like. It is
there only for cosmetic purposes and is not neccesary to the
execution of the program. I hope this has helped you. I have
owned an ATARI since 1980 and am pretty familiar with this
machine.

I own an Amdek Color I with one speaker and in the price range of
$250 to $300. This monitor is great for playing games on (which is
what you'll probably using an ATARI for anyway) but text is not
extremely clear on this monitor. For word processing capabilities
I'd recommend an amber or green screen monitor costing from $100 to

$200 generally. One word of warning. Before you spend ANY more money
on your ATARI, wait and see what the company does. You may well want
to sell your computer for an apple or a commodore 64. Atari's support
for their computer(s), both in hardware and software, has been
TERRIBLE!!! I would sell my machine today but I couldn't get a
good price for it based on the current low prices of ATARI computers.
Warner Communications, who has owned ATARI since it's start, recently
"got rid of" it's personal computer subsidiary and we don't know
what to expect. Just a word to the wise...

There WAS a unit called the 1850 from Convologic in Florida but they
went busto. There are several printer interfaces available that
either hook up to joysticks (you can build them yourself with about
10 transistors and some wire) or off the serial bus, but they are not
really software compatible.
Modems are available that hook into the joysticks also, and have the same
limitations....
About the only other choice that offers reasonable compatibility is the
SWP ATR-8000. It only has one RS232 port, but also offers buffering
(up to 64K) and can control standard drives (8", 5 1/2, or 3 1/2) as either
ATARI drives, or as CPM drives. Additional add-ons that are available are
a CO-processor board that will run 8086 (MS-DOS and CPM/86) as well as
the standard CPM on the Z80A that comes with the unit (can also
function as a RAM-DISK for CPM). This board can have up to 1 Meg.
All in all it's not a bad alternative if you are willing to pay a
little more for a LOT more functionality!!

Before I get on about the business of supplying witty rejoinders,
a couple of questions --

  According to the press, the new "XE" systems are based on the
  6502C CPU chip. Question 1: is it indeed the 6502C, or is
  it the 65C02? Question 2: is there anybody producing the
  6502C chip, now that Honeywell has closed down Synertek?

> 1. Atari has been talking to National for years about the 32000.
> This doesn't mean Atari
> couldn't use the 68020.

I go out on a very thick and strong limb and predict that neither
Motorola nor National are capable of producing their 32-bit CPU's
in Atari-size quantities any time this year. Neither one is even
in *limited* production yet -- but you CAN get engineering samples.

> 2. A hard disk for $400 is quite reasonable.

Yes. As IBM is finding out with their PC-AT, cheap hard disks are
plentiful and terribly unreliable. I predict that this won't stop
Tramiel, who foisted the *cheap* but nearly unusable 1541 floppy disk
drive on C-64 users. And made a pile of loot on it.

> Fancy gate arrays have design
> times of a couple of man months

Wow! I'd better tell my boss about THIS! Here we've been ignoring
gate arrays because even the folks that make them claim best case
turn-around of 6 months to first prototype, and maybe a year or more

until a working design is stabilized.

> The only thing that could
> get expensive is VLSI for things like fancy video and sound chips. These
> designs may have been proceeding for some time now (it is pretty clear they
> have been)

Some (maybe all?) of the designs that were proceeding were being done
on contract by Amiga. Late last year Amiga returned all of the money
to Atari because they were "unable" to produce such chips. (A point
of contention between Atari and Commodore). Did Atari have any
"Plan B" going on? I don't know.

> No, I think this product is coming. I can hardly wait.

Well, you'll just have to.

Sure, the time WILL come when you'll be able to buy a 68K-based
system for a few hundred smackers. Somebody, whether Atari or
someone else, is bound to do it. But not this year. So why
not enjoy what you CAN get this year?

Even when such a system is actually available on your dealer's
shelves, ask yourself if you want one of the first units. Do YOU want
to be the first person to report every bug? Do you remember CTIA's?
If you had bought a Commodore 64 for $595 (the original price), how
would you feel about someone else buying one for $195 (10 months later)?
I, for one, wouldn't buy a micro manufactured in the first 6 months
of production. Why pay top dollar for the first-try design?
When you can't even buy software for it?

Not only that, but consider that by then Atari or someone else
already will have "announced" some even more stupendous product,
which will make the ST look obsolete. That's the way the game is
played. Each manufacturer tries to announce something that will
keep you, the consumer, from buying someone else's machine NOW.

"State-of-the-art means it'll be obsolete just as soon as somebody
comes out with something better."

I am having a terrible time with Infocom's Hitchhiker's Guide to the
Galaxy. This is supposed to be a standard ranking game but I can't
seem to get started even though I have had a fair amount of adventure
games experience. Perhaps I am not doing all I should on the Earth
before trying to hitch a ride on the space ship. I either get killed
when the Earth is destroyed or I try to hitch a ride and end up in
the pitch dark with no way to go any farther. Any hints without
giving it completely away would be appreciated. If you are working
on the game and are farther than I am, drop me a line. I'll keep
a list and maybe we can keep in touch as we work our way along. I
know you can get the hint booklet but I feel that is cheating. Helping
each other out is only semi-cheating :-). I hope to hear from at
least a few people that are working on this game.

My father-in-law recently picked up an Atari 800 (NOT an XL)
and a disk drive.
He is interested in running software to allow him to bill his
customers and track their payments (or lack of).

He does not need a highly sophisticated program (I'm sure
he can't get one anyway).
Does anybody know about software that may meet his requirements.
Please reply by mail (houxb!kfb) or phone (201-576-3073).

Thanks,
Kevin Brand

x
Atari already is hedging the prices of its newly announced peripherals,
although it seems to be firmer about the prices
of the computers themselves. Bryan Kerr, Atari's marketing manager,
put the price of the Sony drives at
"under $200" when asked. The
$400 15-megabyte hard disk drive reportedly annouced by Jack or Sam Tramiel
may turn out to be a $600 10-meg drive.

I heard that one could ask questions on compuserve about the new atari machines and Antic would submit them to Atari which would then respond on compuserve. I have a few questions that might be asked if someone can submit them on compuserve. Of course if anyone else can answer them that is ok too. These are about ST machines.

1. Is the 128k machine expandable to 512k by just adding in 64k chips and if so is there a jumper that can be changed so that it can accept 256k chips for future expandability to 2Mbytes.

2. Is there intelligent disk io that uses a dma controller and priotized interrupt structure ala the ibm pc? This is important when one has to handle interrupts from various sources.

3. Can hard disks and floppy disks be daisy chained or is one limited to just one hard disk and one floppy disk?

4. Is atari planning on supporting the new cd roms for access to large databases or reference guides, etc?

5. Is there any memory management hardware on the machine? This would be useful for porting operating systems like unix, os9, or gnu.

6. How does one go about becoming a software developer for the new machines. That is can anybody obtain technical info for hardware or software development.

7. What are Atari's plans for supporting some form of local area network?

8. Will the peripherals for the new machines be compatible with
Atari's forthcoming 32bit machine?

Note: I don't expect all of these features to be on the ST
machines. After all how much can you get for $400. But, it
should at least form some idea as to it's limitations.

Is Atari? GEM may run on multiple machines, but I'd gotten the impression
that Atari was using a proprietary OS.

[........]
> .....'Spy vs Spy' didn't load when I first
>got it ....

> Kit Kimes

By the way, what did you think of 'Spy vs Spy', I've been thinking about
getting it (I was a MAD fan in the 60's).

My main problem with mail order (and Toys R Us for that matter) is that
I'd like to know a little more about the game before I buy. Used to be
able to demo software at the computer stores and at G.A.M.E.S. before they
went bankrupt. Maybe I just got spoiled, being able to get demos first.

On the subject of other games, has anyone seen any of the 'Alternate
Reality' series yet? A recent Antic (or was it Analog?) had a very
interesting review of the first one, but they only had a pre-release
demo. I've also been hearing about the series (I forget what it's called)
that is already out for Apple and C64, the one that has several adventures
based on various novels (I saw Farenheit 451 for the Apple at FEDCO).

Actually, this newsgroup is probably a good forum for discussing good games
and utilities etc. Here are some of my favorites:

Spelunker 'climbing' game, related to Miner 2049er but a lot better.
Gruds in Space Good graphic adventure, pay no attention to the dumb name
Necromancer Totally unique, 100% of your Atari's features are going
ALL the time. Wacky and hectic.
Montezuma's Revenge A cross between 'Shamus' and Miner 2049er, sort of.
multi-screen obstacle course.

Gateway to Apshai MUCH better than the original Basic 'Temple of Apshai'
            Graphic D&D type. Closest thing to ROGUE on any non-unix
            I've ever seen.
Return of Heracles Great sequel to Ali-Baba, a multi-player D&D type, you
            can add players at any time during the game, best example
            of what a 'user-friendly' interface is, great with several
            people, you're all against the computer and it inspires
            a lot of cameraderie.
Realm of Impossibility
            This used to be 'Zombies', is ONLY good with 2 people.
            One player play is boring, but 2 is wacky fun.
Zeppelin   Latest by the author of Shamus, lots going on, good graphics.

>> MacWhatever off the shelf on anything but an Apple product!).

>Is Atari? GEM may run on multiple machines, but I'd gotten the impression
>that Atari was using a proprietary OS.

In fact, the Ataris use the venerable CP/M-68K with the GSX graphics
kernel. Not exactly a proprietary operating system.

I have an MMP-1150 printer interface made by Microbits Peripheral Products.
I just found out that it can be modified to have a 2K buffer. The PWB has
three sockets, two 24 pin and one 14 pin. Does anyone out there in netland
know what devices and/or PWB mods are required? Thanks in advance.

March 1985 ANTIC Magazine TOC
Theme: Printers

page article

10 COMMUNICATIONS: The Biggest on-line Public Domain Library
A discussion of what is available and of interest to Atari owners on CompuServe.

12 KWIK DUMP
This is a fast screen dump BASIC program that works with most graphics disk file formats, including MicroPainter, Graphics Master, uncompacted Micro Illustrator and your own Graphics 24 (8+16) files. Written by Jerry Allen the creator or PRINTWIZ.

16 FONT MAKER
Design custom font sets for downloading to your Epson FX-80 or Gemini 10X printer. Once the new fonts are installed in the printer, your Atari can be turned off without losing this new character set.

19 LABEL MAKER
Print tiny return address labels with fancy borders, just like the ones sold in mail order catalogs. BASIC. Written for the Gemini 10X printer but can be modified.

21 CUSTOM PRINT
With Custom Print you can make complete printouts of your programs or text files--printing any character in the Atari special set. 32K, BASIC and Disk Drive.

23 ANTIC 1985 PRINTER GUIDE
What to look for in a printer as well as a feature by feature comparison chart on 8 different printers.

30 NEW COLOR PRINTERS
A look at the Okimate 10 and the Seikosha GP-700A.

34 SECRETS OF ATARIWRITER (and Atari printers, too!)
An authoritative compendium of never-documented techniques for using AtariWriter word processing software, plus little-known methods for getting more out of Atari-made printers. Written by Cassie Stahl who used to run Atari's own bulletin board. She now writes documentation for a major Macintosh software publisher.

38 LETTER PERFECT--IMPROVED
A look at Version 6 of LJK's Letter Perfect.

46 THIEF (Game of the Month)
A scrolling graphics maze adventure. Pilot a spaceship through dangerous caverns to recover stolen treasure. BASIC. Runs on all Atari Computers.

48 ZURK (Bonus Game)

Enter the Laserfighting event of the Zurkian Olympics! Only the winner of the first-place Aluminum Medal of Zurk Survives. BASIC with ML sub-routines.

51 SOFTWARE LIBRARY
This is the listings for all the articles in the magazine. 7 programs this month.

67 ASSEMBLY LANGUAGE: KEYBOARD COMMANDER
One-key [control] [shift] commands. Great one-handed commands to aid the handicapped or us lazy typers.

69 THE TOOLBOX: PARALLEL BUS REVEALED
This is part 3 of 4. In this part we're ready to build a serial I/O board to take advantage of the 100,000 bytes per second data transfer speed of the parallel bus interface on the Atari XL computers.

74 PRODUCT REVIEWS
Software:
CUTTHROATS (Infocom)
DREADNAUGHT FACTOR (Activision, Inc)
BEAMRIDER (Activision, Inc)
HOMEPAK (Batteries Included) Great value for money
SUPER-TEXT (MUSE Software) "A living dinosaur"
WRITERS TOOL (Optimized Systems Software, Inc)

Comments: ANTIC says the subscription price is going up next month but they didn't say how much. Anyway, This is the last month at $24. There is an ad in the back for WOMBATS I from Dynamic Software Design. It is described as "new kind of adventure game where the action takes place mostly in your mind." I wonder if they have ever heard of Infocom. Anyway, it is supposed to be a spoof at adventure games and life in general. Sounds interesting but a little steep at $27.95 + $2.00 S&H. The ANTIC Software Catalog is the same as last month. Has anyone ordered anything yet?

What $400 15-meg drive? The only one I've heard of yet was the
$600 (or was it $699) 10-meg drive.

{ Is the line eating bug related to Elizabeth Taylor? }

    Come on folks, I'm getting bored (not to mention envious) of the
 endless discussion of what Atari is going to bring out this summer. Doesn't
anyone use the Ataris they have got now?

    Let's have some articles about the goodies we've got now. Here are
some suggestions:-

 o Reviews of interesting products- peripherals, utilities, languages, and
    games.

 o Discussions of programs and languages (e.g. the brain-damaged 'records'
    in Action.
 o Small programs, e.g. 25th line clocks, Typeahead Buffers etc.

 o Bugs and features of the Atari hardware and software.

     Here are some things I'd like to know:

1. How do you read the XL 'Help' Key? ((Strangely, under the 'Translator' OS,
   it produces a key-click when pressed)
2. Does anyone out there use QS Forth on an XL? Have they cured the
   compatability problem (It works, but no output reaches the display) ?
3. Let's whine about Action; I love the fact that it is in ROM, that it
   compiles fast, and *is* fast, but why can't you have pointers in records?
   I hate using CARDs. And why are all variables static? Just try writing
   recursive programs! (I know you can use arrays, but I want to be
   difficult) >-{
4. Has anyone out there got 'Deep Blue C' or whatever; I'd like to use 'C'
   on my Atari, and I'm not impressed by C/65. Appraisals, please.

If you mail me, I'll post all your spelling mistakes on the net, so come on
all you colonials, you invented the thing, get moving!!

     Yours sincerely (I kid you not),

          Tim Bissell

[I've always been mad, I know I've been mad...]

>According to the new ANTIC magazine, De Re Atari is no longer available.
>They recommend the book 'Advanced Programming Techniques for the Atari'
>by Linda Schreiber. It is available from TAB books and is close to
>De Re Atari and is much clearer.
>
>   Kit Kimes
>   AT&T Consumer Products

                I never had De Re Atari, but I did buy Ms. Schreiber's book _Advanced_Programming_Techniques_for_the_Atari_. I found it to be one of the LEAST clear programming texts I have ever read. I pondered over some chapters for great lengths of time, trying to decipher her incoherent explanations. Now, I am not a graphically inclined person (I had the most trouble with the graphics sections), but I do consider myself to be sufficiently competent with computers in general to be able to understand a text like that. I found this book to be an extremely poor exposition of programming techniques, and I would recommend staying as clear of it as possible. If this book is clearer than De Re Atari, then I shudder to think what that latter book is like.

[Aren't you hungry...?]

     On the topic of standard environments - no one says you must use the Mac ROMS. I suspect that some of it is useful and that a GEM implementation might be done fairly painlessly for the Mac. Any thoughts?

Jon Shapiro

Has anyone heard anything about GEM for the mac??? I know that it might be a
bit like hobbling a racehorse so it can pull a plow. But I'm curious
about the possibility of using my mac to develop software for these new machines
It seems to me like it should be awfully easy for anyone so inclined to put GEM
on the mac (or is it??)

I am intrested in forth on the atari. I know of the public domain Antic
forth, valforth, and PNS forth. Has anyone used these? If so, which do you
like and for what reasons.

I also bought logo yesterday. The documentation consists of a list of
valid commands. Does anyone know how different atari logo is from apple
logo. The logos were both written by the same company (LOGO inc.).

Recomendations for forth books and logo books welcome.

Contrary to early reports, the Atari ST computers will not use CP/M 68K,
rather an incompatible offspring of CP/M designed to take advantage of the
Graphics Environment Manager.

I have an Atari 400 and Atari's 835 direct-connect modem.
What I DON'T have is terminal emulator software for this
configuration. Atari recommends (or used to) their
TeleLink II cartridge -- however, since both the cartridge
and the 835 modem have been discontinued, I haven't been
able to find a TeleLink II (plenty of TeleLink I's around,
though).

Does anybody know of any other terminal emulator software
for the 400 that supports the Atari 835 DC modem -- or,
miracle of miracles, know where I can get the TeleLink II
cartridge ???

Here's hoping. . .

I just bought Thorn EMI's "Jumbo Jet Pilot," only to discover that
the directions were missing. The store (liquidator) I bought it
from says, "We don't make exchanges or refunds -- take it up with
the manufacturer." But without the direction sheet, I don't know
how to get in touch with Thorn EMI. Can someone help me out?

>4. Has anyone out there got 'Deep Blue C' or whatever; I'd like to use 'C'
>   on my Atari, and I'm not impressed by C/65. Appraisals, please.

I've got it. Not too bad (though my version has a bug in
setting graphics modes). However, I find I don't use it much.
Most things for which I want quick development, I just do in BASIC.
Two reasons:

1. Compile time. I write something, start compiling, and take a nap.
   Later (much later) I then have to link it all. Take another nap.
   Oops. I really want the output to look like this. Take two
   more naps. What if I change that? Take two more naps.
2. Run speed. When I ran a program, it didn't seem all that fast,
   so I tried running

```
10 look at atari built in clock
20 FOR I=1 TO 1000
30 FOR j=1 TO 1000
40 NEXT J
50 NEXT I
60 look at atari clock again
70 print difference
80 END
```

   and a C equivalent. Deep Blue C was faster by a factor of 3.
   Somehow, I thought a compiled vs interpreter should do better than that.

Anyways, C usually isn't worth the trouble. If I'm going to the trouble,
I'd just as soon do it in assembly, and make it *fast*.

> difficult) >-{

Really the problem is that for fast code Action doesn't use
a stack frame- on a 6502 you only get 256 bytes of stack so
if you want truly recursive procedures you have to use the
hardware stack to hold pointers to a software stack. C65
does this, but as we all know, that language is truly brain
damaged, and SLOOOOOOWWWW.

Not only won't Action! let you have pointers in records, but
I ran into the following bug:

```
;* excuse syntax errors, I can never switch from c to action too well

CARD ARRAY dur(4)
BYTE count
          init_dur();
          FOR i=0 to 3 DO
               dur(count) == -1;
               if (dur(count) = 0) then
                 do_something();
```

```
                fi;
            OD
```

This code was supposed to decrement card values in the card array dur, except that the compiler got all confused... refused to byte reverse values in dur before decrementing. It didn't matter what I used to point into the array.... same results. I fixed it by calling a function to perform the decrement, i.e. decr(dur,count)!!!!!

WORSE YET- this was entirely context sensative!!!!! Similar code worked fine in different situations.

Add this to the inability of the compiler to operate on cardinal values greater than 0x7fff, and you have a piece of software that should never be used by anyone.

What really bugs me is that OSS has no intention of fixing any of this sh*t. And if they do... you can bet that it won't be the free upgrade that it should be.

The real problem is that the 6502 doesn't really support a stack. ACTION!
doesn't support recursion for just this reason. Come on now, how often do
you really write recursive routines? How many of them need to be? Not too
many I'll bet. I think most people would rather have the speed advantage.
If you don't, used Deap Blue C or C/65 (which are missing several other
features).

>   Not only won't Action! let you have pointers in records, but
>   I ran into the following bug:

True, ACTION! on the Atari doesn't support pointers in records, but there
were some features that had to be left out to fit it in the 16K cartridge.

```
>    ;* excuse syntax errors, I can never switch from c to action too well

```

I sure wish I knew what you did. My guess is that the program was incorrect
(like this one is). I tried the following and it works just fine:

```
  CARD ARRAY dur(4)
  BYTE count, i

  count = 1
  dur(count) = 3
  FOR i = 0 TO 3 DO
    dur(count) ==- 1
    IF  dur(count)=0 THEN
      PrintE("works")
    FI
```

OD

> Add this to the inability of the compiler to operate on cardinal
> values greater than 0x7fff, and you have a piece of software
> that should never be used by anyone.

I only know of one place where hex values do not work properly. That is for declaring the size of an array. This is a known (and documented by OSS) bug that has been fixed for the next revision of ACTION!. If you would like to provide an example (other than that mentioned above) where hex constants or CARDinals don't work properly, I would like to see it. Reported bugs in ACTION! ARE FIXED!!! But it is hard to fix a bug if you don't know that it exists.

> What really bugs me is that OSS has no intention of fixing any of
> this sh*t. And if they do... you can bet that it won't be the free
> upgrade that it should be.

I normally don't post messages here, but I could not let this one go by without a response. First, OSS does support its product. They have come out with 4 revisions to ACTION! since its initial release. The current version is 3.6. They also will give you a bug list if you request it and many of these have been described (with fixes) in their newsletter. If you didn't get a news letter, then you probably didn't send in the registration card (how are they going to send you a copy if they don't know who you are). They provide upgrades for old versions of the cartridge for $30.00. Now I know that isn't exactly cheap, but they do have to give you a whole new cartridge when they do it. (Let's face it, ACTION! isn't the biggest selling program in the world and low volume items carry a lot of overhead.)

- Clinton Parker
  Action Computer Services

ps: ACS really does like to here reports of bugs in ACTION!, but to be fair many of the reported bugs are actually programmer errors. I know this does not make the programmer feel too good when he/she is told this, but you should realize that it is very hard to fix something that isn't broken. Many reported bugs (that aren't) also deal with misunderstandings of what the user think ACTION! can do and what it really can do. For these, I am sorry, and again, would be willing to listen on how the manual could be improved (yes I know it's not that great) to correct these misunderstandings (specific examples would really help here). Thanks.

On the point of Atari designing there own Video chips for the ST, I don't think so. The specs given for the ST machine look exactly like those for Motorola's new RMS/X color video controller chip set. A nice chip set that has everything one could want for a personal computer. The only question of mine is availability. The chip set isn't going to

be available in production numbers for a few months still at least I
think. The same for the floppy/harddisk interface that is supposed to
come standard. Motorola has a new VLSI chip set designed to handle that
too. All these chips were designed with the 68000 in mind. Now if
someone like Atari would only use them for something...

> 3. Let's whine about Action; I love the fact that it is in ROM, that it
>   compiles fast, and *is* fast, but why can't you have pointers in records?

Sure, it's easy to whine about a product, but do you really think
that it will really help. We could TALK about Action!, and any of it's
short commings and benefits, and then maybe get something useful out of
it.

Granted, Action! is not a full implementation of Pascal, C or Ada, but
neither is it BASIC. I don't want to argue about about BASIC, it has
it's uses on the Atari, but we all know it's disadvantages. One of
them being a complete lack of pointers. Having pinters available
makes programming some tasks so much easier. That, with the ability
to bind variables to a physical location, and bit-wise logical
operators give the programmer great control over their machine without
all the details that a complete assembly language program would require.

As an example, here is a procedure that I wrote to overcome a feature
of the Sound procedure in the library that came with the early versions.

```
     ;************************************
```

```
;* PROC: sound                          *
;* PURPOSE: Loads the sound registers *
;*   with desired values for channel, *
;*   frequency, distortion and volume *
;*   as compatible with the BASIC     *
;*   sound function.                  *
;* CALLED BY: any PROC or FUNC        *
;* CALLS: nothing                     *
;*************************************

PROC sound(BYTE chan, freq, dist, vol)

DEFINE AUDIOBASE = $D200    ; Beginning of sound register table

BYTE AUDCTL = $D208,        ; Audio control option byte
     SKCTL = $D20F     ; Serial control byte

BYTE POINTER audio     ; An index into the sound table

AUDCTL=0           ; Set no options
SKTL=3                  ;  ditto

vol = vol & $F              ;Strip off volume bits
dist = dist RSH 1      ; Divide by 2 to adjust for 3 bit value
dist = dist LSH 5      ; Align to proper bit locations

chan = chan & $3       ; Strip off channel info
audio = AUDIOBASE + 2*chan  ; Align to proper channel in table
                   ;  of sound control bytes.

audio^ = freq          ; Store an 8 bit value
audio==+1          ; Point to next control byte
audio^ = dist + vol         ; Store concatenated bits into byte

RETURN
```

I wrote this a year ago December in about twenty minutes, including the time needed to read through "MAPPING THE ATARI" to figure out where the sound channel bytes were located, how they were used .... Now, try doing this in BASIC, sure it could be done, but I wouldn't want to. Assembly, sure possible here too, but this is certainly clearer to read and understand, and was much easier for me to write. What also made it so easy to do was:

1) Bind variables to memory locations. No POKEs here, (POKEing in Action! IS Brain Damaged) I used the Atari's hardware registers as any other variable would have been.

2) Bit-wise operators. The sound registers store the three parameters into two bytes, so the two have to be isolated and then combined. Is there really any

other way you would want to do this?

3) Pointers. This made getting into the table a simple offset problem. But in fact this may not have been needed, I probably would have been able to declare a byte array to reside there and then used the array index for access. I have not tried this here, but I like the pointer it makes sense.

So I think the language is very useful for a variety of tasks. Sure, the manual SUCKS!, Clint admits this but he didn't write it so he has to live with it too. It is misleading and in certain instances WRONG.

Action! is not a complete language, full of everything you would want, but it has enough to get by. If you play with it awhile you start to learn it's peculiarities and can make adjustments to them.

MY big gripe is the cartridge itself. It is a piece of ****. I have had my cartridge a little over a year and the tin-foil that OSS tries to pass for contacts on the board are a joke. Mine are already worn out so that when I boot the system the cartridge is NOT RECOGNIZED. I end up in DOS-XL and when I try to go to it I get some sort of "NO CARTRIDGE" error message. This little trick is really irritating when the cartridge "DISAPPEARS" while I am using it. No amount of cleaning helps and this does not happen with any other cartridge. What really sets me off about this is that I really have not used it that much. In fact I didn't touch it at all during September - November. I could not have had it in and out of the machine more than 100 times if that. I do not think that it's life should have been entirely consumed already. I imagine this is a common problem but I do not know for sure. This just started 5 weeks ago and I have not tried to contact OSS about it yet.

>
     The version 3.6 has been out for about a year. It has numerous
     bugs. Given the state of the 800 series, I really doubt that
     a new version will be released. I don't think that asking
     $30.00 for a new cartridge to replace the previous bug infested
     version qualifies as support. Not when the stuff comes with the
     standard shrink wrap disclaimer "this product not guarenteed to
     function."

     Despite my non-recommendation of Action, it's still the best
     high level language available for home computers. I accept that
     most software has bugs, but companies that sell software tools,
     such as compilers, operating systems, word processors, etc.
     should be responsible enough to provide support. Presumably, thats
     why this kind of product demands a higher price than pac-man.

                              Mark Roddy

I am helping someone whose niece, age 6, is a victim of cerebral palsey
and who has shown interest in having a small computer. For financial
reasons, we are looking at the popular 8-bit machines for which a broad
software base exists (Apple, C64, Atari).

Apparently, the child has severe fine motor impairment; she cannot write
and probably has little dexterity with her fingers.

Therefore, we are looking for microcomputer add-on keyboards made for
such folks. Please keep in mind that the "keyboard" has to be
interfaced to the computer and we'd prefer not to have an R&D project as
the aunt, the niece, and I are on west coast, central US, and east
coast, respectively.

Please mail or post replies to net.

Thanks,

Brint

I have noticed several comments in this newsgroup stating that
the graphics on the atari is superior to the c64. I personally
have a c64 although today the atari is a better buy. However, I
always thought that the c64 had better graphics and sound
hardware than the atari. I realize that for basic programming
the atari graphics and sound is very easy to use since the
keywords are built into basic. But for applications programs
and games the c64 seems to have the edge. It has 16 colors in
the hi res mode (limited to two different colors in any 8x8 block)
vs only 2 shades for the atari. The sprites in the c64 can be
moved in the x and y directions where as the player missiles
in the atari can only be moved horizontally. The sound chip on
the c64 is a real synthesizer with ADSR features, filtering, the
ability to modulate one voice with another, and external input
as compared with atari's more primitive distortion parameters.
I have heard that the 800XL's have a newer antic chip that
allows more graphics modes, but on the surface at least the
c64 seems to have the edge. I am sure that there are some arguments
for the atari that I may have missed and I would enjoy hearing
more pro's and con's about the two machines.

Help! I had two 1030 modems on order from a local Atari dealer. After a charging my VISA and waiting a month, he says he can not get them. One was a birthday present for Nov. 21st. The other for my boss. During the wait I saw the 1030 come and go at Toys-R-Us for $59.00. Nowone here in the Seattle area seems to have any. I am willing to mail order as long as deliver can be assured.

Thanx in advance.

Computer System News for Dec 17 indicates that Jack Tramiel has announced the ST130, a 68000-based system under $400 to compete with the MacIntosh. The operating system (supposedly called TOS, Tramiel O.S., but I have my doubts that it will be marketed that way) was developed with Digital Research.

That's what the article said. A little short on specifics. But guessing from the ubiquitous GEM showings at Comdex, I suspect that this is the MacIntosh-like interface involved. The OS is, then, likely to be related to CP/M or Concurrent DOS.

Couldn't let this go by...

The ATARI player/missle graphics may not scroll vertically, but they have
the 'feature' of being able to cover the entire screen, top to bottom, in
the 8 pixel horizontal range. Although this is more difficult to scroll
up and down, it is more flexible.

It is true that there is no attack/decay in the atari voice system, but
there are 4 true voices vs the c64 3+1 white noise. The atari voices can
also be clocked by various sources, and can even be combined into fewer
voices for a wider range.

The c64 8x8 block garbage is hardly flexible. I prefer a standard bit map,
although less colorful, and work with artifacting in a straight forward
manner. I have seen the documentation on the c64 graphics system and
the 800 is far superior in capability overall, especially the display
list system. I don't believe the c64 has anything like the powerful atari
display list processor.

Some of these features are hard to compare. Your description of
the Commodore '16 colors in hi res' obviously has limitations,
(only 2 in any 8x8 etc.) The Atari features are different and
may also have limitations. True, the Atari technically only has
2 colors in hi-res, but with proper use of the display list, you
can have 128 colors (or is it 256?), limited to two different
shades on any raster line. With the display list, you can mix
graphics and text modes on the screen like crazy, ie: a screen
with 1. four raster lines of hi-res, then 2. a text line, then
3. 20 pixel lines at medium res, etc. ad infinitum (or at least
until the bottom of the screen) The display list will also
facilitate scrolling of all or part of the screen either
horizontally or vertically without moving any of the actual
data. Display list interrupts can be used to divide the 4 (actually
5) players into seperate entities, provided they only move horizontally.
(actually you might even be able to do vertical movement like this with
some cute tricks). In this way, each of the 5 players could be divided
into up to 192 individual horizontal moving 'sprites'. Of course at
192, each sprite is 8 horizontal by 1 vertical. Collision detection
is built in for player-player, player-background, etc. but I suppose
the Commodore may have this feature. I've heard nothing about any
display-list type features in the C64. If there are any, I'd like to
hear about them.

I must admit though, the Atari sound generators are not particularly impressive. The best feature is that there are 4 of them and you can combine them for more sophisticated effects. The worst feature is that there is only 1 'tone' while there are 7 'noises'. The 1 'tone' is approximately a sine wave, so you don't have much control over timber. You can change the clock rate to the generators in order to drop to lower octaves (more bass!) and you can inter-combine them in some odd ways that I haven't gotten around to experimenting with. I don't particularly miss an ADSR, as this is a slow enough function that it can be 'simulated' with a clock interrupt routine. (nice not to have to do it that way though) One feature however, is the volume-only mode, where you turn off the sound generators, and use the volume control as a 4 bit D/A. S.A.M. uses this for it's speech synthesis output, and does an excellent job, however, you have to turn off all interrupts and DMA etc. because they affect the timing adversely. This means a blank screen when you use this sound feature.

I don't know much about the C64 except it has 32 sprites. I guess it just uses the T.I. 9918? (no display list or associated interrupts). All I know about the sound generators is what was said in the above referenced article.

I would like to know what versions of FORTH people are using on the C64. I use it exclusively for Atari programs, and would like to know what the best commercially available C64 version is.

I received 5 replies to my request for monitor recommendations for
an Atari 800: 3 firmly recommended Commodore, model 1702, because
it has separate luma and chroma inputs, 1 recommended an Amdek Color 1+,
and 1 recommended the Amdek Color 3+.

Thanks for everyone's input. I'll probably buy the
Commodore 1702 for $247.93 and the proper cable for the Atari
for $9.95.

My uncle just got a 1050 disk drive for his 800XL. He needs to
find out about the translator disk. Can someone out there
please tell me what this is/does and where it can be found? Is
it PD?

Thanks!!

The Translator disk is not in the public domain. It is available
from most Atari software dealers. If you can't find it, let me know.
It is not expensive, it only costs $15.00.

According to the latest issue of ANTIC, they are now on CompuServe. Does
anyone here log on to CompuServe regularly? The reason I ask, is because
Antic is going to provide nightly updates for Atari fans during the
Winter CES. The show is Jan. 5-8. If anyone can log on, you can
go directly to the Antic area by typing GO ANTIC. If anyone can get the
updates, please summarize them for the net. Thanks.

While picking up my Commodore color monitor last week, the
dealer told me that Commodore has been having reliability
problems. He said that Commodore has a 20% return
rate for their 64 versus Atari at about 5%. He also said
the return rate for the coleco adam was 80% and that he no longer
will sell it.

These numbers weren't just for his store, but for sales nationwide.

I haven't seen anything about the ill fated 1200XL. I have noticed
these in the store again, have they been reintroduced or did someone
buy the atari closeout.   I am unfortunate owner of one (through
    no fault
of my own) and have had a lot of trouble with software that doesn't
run right. What are differences between the 1200XL and the other XL
computers? Am I doomed (at least to have to buy a newer one (^:)?
Any comments would be appreciated, Thanks.

I looked at the Commodore monitor today at my friendly local Kmart;
used with a commodore 64 (I don't know if it has separate luminance and
chroma outputs) the flicker was UNBEARABLE. I couldn't adjust it away...
Is this a problem with this monitor, or is the C64 not a good test machine
for it? The sharpness was excellent, which leads me to believe that
the luma/chroma WAS separate. If it weren't for the flicker, I would
consider one for use with my 800.

By the way, does the 1702 take standard composite video through the front
panel jack? The salesperson was, ahem, not exactly on top of things.

I've seen many references to the book "De Re Atari," which is
apparently the Atari technical bible. Does anyone know a source from
which De Re Atari is available?

The Atari Program Exchange, which once sold the book, is reportedly
no longer in existence.   It was also excerpted in Byte in 1981/82,
but that series of articles is probably not as complete as the book.

I'm surprised that there are no advertisements in Antic or Analog from
someone who feels the need to provide the Atari user community with
this seemingly invaluable document. If there is no commercial source,
I'll have to find a local Atari expert who would be willing to loan me
the book.

Thanks,
Dan O'Connell

As far as I can tell, this flicker isn't a common feature in any of the several dozen 1702s I've seen, and is probably indicative of a faulty monitor, or rotten Commodore software. Incidentally, per somebody's previous question, the Commodore DOESN'T use the 9918. This is fairly obvious from the resolution of 256x192 for the 9918 vs 320x192 for Commodore's part, numbered something like the 6567-II.

(the following is an editorial comment)
   Doesn't really matter, since I hate Commodore to the core. (Of course I do, I've got an apple. And I'm just waiting for Tramiel's 68000 machine.)

And yes, the front jacks on the 1702 are in fact normal NTSC video. And they look wonderful plugged into a Betamax.

Hopefully useful

Can anyone give me instructions for screen installation of Turbo Pascal
on my ATR8000?
Specifically, my problem is this:
     From the Turbo editor, whenever I do a CTRL-Y(delete line),
     the bottom screen border increases in size by one line
     in length. This throws the whole display off.
thanks in advance for any help given.

*** I am not a bug but a feature you havn't met yet ***

   The February `85 issue of ANALOG Computing mentions the new Atari
computers in the editorial. The 16-bit machine will use Motorola's
68000 chip which although called a 32-bit chip by some, it's the same

CPU used in Apple's Macintosh, uses a 16-bit data and address bus.
   It will not be IBM compatible but use an in-house operating system developed by Atari. The machine will feature GEM (Graphics Environment Manager) by Digital Research which will enable it to use such Macintosh-like features as pull-down menus and windowing. Specifications have already gone out to software developers. If everything is on schedule the new computer will be shown this weekend at the Consumers Electronic Show in Las Vegas this weekend. Stay tuned!
   The 32-bit machine will use National Semiconductor's own NS32032 microprocessor makeing it a true 32-bit machine and will be the first home 32-bit computer (although there are 32-bit machines available that you can fit on your desk they cost more than you make in a year!).
   It is still scheduled to be shown at the European electronics fair in Hanover, West Germany in April.

 I have recently acquired a MPP-1000C modem. The smart terminal software
 supplied with it does not indicate what type of terminal it emulates.
 Does anybody know what terminal type I can specify when I log in on
 unix that would send the correct control characters so that vi would not
 work in the open mode.

I had a free hour of connect time on compuserve when I bought my
vicmodem about a year ago. I had never used it, but now seemed
like a good time to find out about the new atari products, so I
pulled this preview from compuserve's online magazine. The
details still seem sketchy but at least they are official
statements by atari. I hope you find this useful.

EXCLUSIVE ANTIC PRE-CES ATARI PREVIEW:

5 NEW '85 COMPUTERS -- PLUS MONITOR WITH 80-COL CARD, 500K DISK DRIVE, PRINTERS, MODEM, MOUSE...

1/2/85 by NAT FRIEDLAND, ANTIC EDITOR

Antic Magazine got a look at the 1985 Atari Computer Line-Up
three days before it was due for unveiling at the Consumer
Electronics Show in Las Vegas.

This Antic Preview was hosted at the Atari Engineering Center
in Sunnyvale by Sig Hartmann, President of Atari's Software
Division, and Sam Tramiel, President of the Atari Corp.

Prices for many of the new products were not going to be
finalized until 24 hours before CES opens. Manufacturing of the

new computers won't begin earlier than March, which means they won't be appearing in the stores until at least May or June.

Atari will be showing three new 8-bit XL-compatible computers at CES. A 128K version, the 130XE, will be priced around $200. The 65XE, the next-generation 800XL, will cost around $100.

The keyboards and cases of these machines will be dramatically changed. They will be smaller versions (no 10-key pad) of the spectacular 16-bit computer housing. Inside the XE computers, the circuitry has been simplified and chip functions have been combined. Sam Tramiel said that this will make the XE a more reliable machine than the XL while maintaining 100% compatibility.

There will also be a luggable 8-bit XE that comes with 128K, a small video screen and a disk drive, the package selling for around $400.

The XE computers will use a new DOS 2.5, which Sam Tramiel said is very similar to the classic DOS 2.0S. The new DOS is necessary so that the XEs can accept the new 500K 3 1/2" disk drives as well as the current 1050 drive. The built-in BASIC has not been changed.

Hartmann & Tramiel brought up and agreed upon the necessity of exchanging DOS 2.5 for the DOS 3 packaged in hundreds of thousands of new 800XLs sold at Xmas. They were very open to Antic's suggestion that DOS 2.5 be uploaded onto the CompuServe Atari SIG and distributed to users' groups as soon as it's finalized.

Hartmann also proposed that Antic assemble users questions via CompuServe each month and turn them in to him. He promised prompt answers from Atari's top management through Antic. Sam Tramiel was enthusiastic about the arrangement and Antic is starting it right now! Upload your questions for Atari on the Antic Electronic I/O Board and we'll be online with the first round of answers before the end of January.

ANTIC WRITE-INS SAVE PARALLEL BUS!!

Good news that many of us have been waiting for! The XE 128K computer will maintain an open parallel bus for plug-in peripherals. The PBI will even be improved over the current XL format -- with improved timing and a built-in +- 5 volt power amplification.

The last-minute decision to continue the PBI came at an engineering meeting called by Sam Tramiel in response to Antic's write-in campaign on CompuServe's SIG*ATARI.

As for the two new 16-bit machines, they can be described in

one word -- phenomenal.

The 130ST is a non-expandable 128K computer and the 520ST carries 512K, that's the only difference between them. They both use the Motorola 68000 chip which is also in the Apple Macintosh. They both use Digital Research's super-fast Macintosh-like GEM user interface, which sits on top of DR's CP/M 68K operating system.

Each model also has 196K built-in ROM containing GEM and CP/M 68K. An Atari mouse will be available to run GEM's icon menus. Both computers will be capable of running the highly-rated DR version of Logo. C or Pascal will be the development languages of choice.

The state-of-the-art keyboard for the 16-bit machines includes: full selectric-style key layout, 10-key number pad, cursor pad with Help and Undo keys, and 10 function keys. The entire back of the casing is honeycombed with ports, including: parallel and serial interfaces, MIDI musical interface, PBI, etc.

The one sad note at Antic's preview was that the long-rumored AMIE 16-voice sound chip was not totally ready for production yet. The AMIE, which is said to emulate human speech and singing with unprecedented accuracy, will be incorporated into the '85 Atari line later in the spring and will be identified by adding the letter M to 8-bit and 16-bit models that include it.

Another '85 breakthrough is Atari's sleek, compact 3 1/2" disk drive with 500K storage capacity. Sam Tramiel said this drive will be in the incredibly low price range of $100. Tramiel told Antic that the 500K drive, which uses the same sturdy 3 1/2" disks as the Macintosh, will be compatible with both the 16-bit and 8-bit computers.

"We've had long discussions about the issue of disk compatibility," said Tramiel. "But our conclusion is that we're going to strongly encourage software developers to bring out their new programs primarily on 3 1/2" format. At the low price we'll be selling the new drive for -- frankly 8-bit users would be foolish not to eventually upgrade to a far superior product and format."

However, the current floppy-5 1/4" 1050 disk drive will continue to be manufactured as long as there is a market for it.

In yet another new move, Atari will be showing a wide line of printers and monitors, which will be aggressively marketed for use with IBM and Apple computers as well as Ataris. When asked who was actually manufacturing these new peripherals, Sam Tramiel laughed and said, "Japan Inc."

The Atari printers -- all aggressively low-priced -- will

include a 12-cps daisywheel, an 80-cps dot-matrix, and three $50-100 thermal transfer models, including one that prints in color.

The monitors include a 12" monochrome for about $100 -- with a built-in 80-column card for the XE and XL 8-bit series -- and a 14" color monitor for about $200 which will compete with the popular Commodore color unit.

A 640x200 resolution RGB Analog model capable of displaying 512 colors will sell for around $300. There will also be a $150 high-resolution 640x400 monochrome model for the ST series.

Atari also plans to show a monitor with a built-in floppy disk drive, plus a low-cost (around $50) 300-baud modem bundled with software for uploading and downloading.

Software president Hartmann described Atari's goal as "switching from a computer game company to a microcomputer company." He said that Atari Software will primarily publish entertaining and easy-to-use productivity programs. "We'll be very selective about games, only publishing games that we believe have a real chance to become major hits."

By the day before CES, Hartmann expected to sign the contract for Atari to bring out an integrated program comparable to Lotus 1-2-3 -- but with code so compacted that it will run on 64K. If this deal is finalized in time, Antic Online will upload a description of the product from CES.

Also under development is AtariWriter Plus, which will include integrated mailmerge and spelling checker. It is to all run on one disk at 128K.

Hartmann said he is determined to reach out for user group feedback in the fast-moving software market. He specifically wants major users groups to act as beta testers for new Atari software.

As a first step towards this, Hartmann said he will bring top Atari executives to meet with users' group officers at the special invitational Worldwide Users Network meeting which Antic will host at our offices during the West Coast Computer Fair in March.

Well, Christmas has come and gone and with it has come an increase in the number of micro computer users...including my roommate, who now has a monitor for the Atari 800 he has had since fall. Unfortunately he does not have any manuals, the person who gave him the computer forgot to give him the manuals.

The equipment he has includes the 800 basic system unit, the BASIC cartrige, a centipede cartrige, a tape unit and one game stick. If anyone knows where the documentation can be obatined, I would appreciated the info.

Here's more speculation with which to fuel the rumor mills:

Infoworld, Jan. 7 & 14, 1985

Atari Awash In Product Rumors
Several Machines Expected at January Show

With the Consumer Electronics Show only a week away, the home computer industry is awash in speculation concerning Atari Corp.'s promised line of 8-, 16-, and 32-bit machines. But Atari, through marketing manager Bryan Kerr, will confirm only that the 8-bit computers are a continuation of the XL series and will be fully compatible with the Atari 800XL, which was recently reduced in price from $180 to less than $120.

While Kerr would not comment further, sources close to the Sunnyvale, California, firm say Atari is preparing an 8-bit, 128K computer, probably to cost less than $250. To cut costs, Atari will not put a parallel bus on the new machine. This means that users won't be able to plug in an 80-column card but will have to settle for a 40-column monitor display. (The Atari 800XL comes with a parallel bus). The new machine will use a Motorola chip from the 6500 family, probably the 6509, says a software manufacturer. The 800XL uses the 6502.

Several other 8-bit machines are also being developed. Atari boss Jack Tramiel may revive the Atari 1450XLD, one of Atari's higher end computers

with a built-in modem, a project killed by former Atari chairman James Morgan. Sources overseas say that on Tramiel's recent trip to Amsterdam, Holland, he told developers he was working on a portable computer as well as a microcomputer with outstanding music capabilities. These machines will sell for between $100 and $300.

The greatest interest among industry observers has been concentrated on the firm's more powerful 16-bit "Jackintosh" computer, a system based on the Motorola 68000 chip used in Apple's Macintosh. Pundits are calling the Atari brainchild a "color Macintosh". The computer will feature a version of Graphics Environment Manager (GEM), Digital Research's newly announced software operating environment. GEM features icons, pull-down menus, and overlapping windows. It is not yet known whether the 16-bit system will include a mouse. Developers at the Pacific Grove, California, software firm say the operating environment works best with one. Digital Research says it has also worked on the Atari proprietary operating system.

The new 16-bit machines, which will have either 128K or 192K of random-access memory, is expected to be sold in three configurations: the basic computer for $399; the second unit with a built-in, 3-1/2 inch Sony disk drive for $599; and the third package, with a disk drive and color monitor, for $799. By comparison, the 128K IBM PCjr with one disk drive and color monitor and the 128K Apple IIc with one disk drive and no monitor both sell for about $900. Atari's computer will feature "full synthesizer sound," says one East Coast software executive.

Yet another Atari machine is reportedly in the works. According to one Atari insider, the firm is planning to license the technology from Mindset, a start-up company based in Sunnyvale, California. In March, Mindset announced the Mindset micro, and IBM PC compatible offering superior graphics capabilities as a result of two custom graphics coprocessors made from VLSI technology. The machine, however, never made a dent in the market, and Tramiel has been interested in the Mindset computer since he came to Atari in July. Atari may show the Mindset micro with an Atari label on it at the Consumer Electronics Show.

Atari executives remain tight-lipped about their high-performance, 32-bit computer scheduled to be unveiled in April at a Hanover, West Germany, computer show. Some sources say the computer will run on the National Semiconductor 32032 chip, a chip so powerful that it will make the computer "functionally equivalent to a DEC VAX." Other sources at Atari insist the 68020 chip will be used.

Meanwhile, Atari reports that the 800XL sales have been astronomical since the November price cut. Stores such as Service Merchandise in San Jose, California, say they have sold out. By the end of 1984, the Atari 800XL will have sold more than 600,000 units since its introduction more than a year ago, according to Kenneth Lim of Dataquest, a market research firm in San Jose.

"Our top accountants are telling us that the computer is outselling the Commodore 64," says Atari's Kerr. "We've had to expand our volume shipments to our distributors."

Since November, orders for Atari software have been exceptionally strong, according to Michael Reichmann, director of product development at Batteries Included, a Toronto software firm. "The demand has been unbelievable," Reichmann says. "I think Commodore is really running scared. Tramiel shows that he is willing to fight tooth and nail with Commodore." Stores that didn't want to carry Atari software are now placing orders.

Tom Bennett, head of an Atari users group in San Leandro, California, says he gets calls daily from owners who bought the 800XL because of the price and now want to know what can be done with it.

Let's hope Atari makes its new high-end machines open and expandable (gimme slots! Lots o' slots!), increases the 128K RAM to AT LEAST 512K, and uses FAST AND RELIABLE disk drives. After all, Atari should have learned from the complaints about Apple's Mac. Let's hope Commodore pays attention when it comes out with its new machines, too. We certainly don't need a repeat of the 1541 disk drive troubles (slow and unreliable).

EXCLUSIVE ANTIC PRE-CES ATARI PREVIEW:

5 NEW '85 COMPUTERS -- PLUS MONITOR WITH 80-COL CARD, 500K DISK DRIVE, PRINTERS, MODEM, MOUSE...

1/2/85 by NAT FRIEDLAND, ANTIC EDITOR

Antic Magazine got a look at the 1985 Atari Computer Line-Up three days before it was due for unveiling at the Consumer Electronics Show in Las Vegas.

This Antic Preview was hosted at the Atari Engineering Center in Sunnyvale by Sig Hartmann, President of Atari's Software Division, and Sam Tramiel, President of the Atari Corp.

Prices for many of the new products were not going to be finalized until 24 hours before CES opens. Manufacturing of the new computers won't begin earlier than March, which means they won't be appearing in the stores until at least May or June.

Atari will be showing three new 8-bit XL-compatible computers at CES. A 128K version, the 130XE, will be priced around $200. The 65XE, the next-generation 800XL, will cost around $100.

The keyboards and cases of these machines will be dramatically changed. They will be smaller versions (no 10-key pad) of the spectacular 16-bit computer housing. Inside the XE computers, the circuitry has been simplified and chip functions have been combined. Sam Tramiel said that this will make the XE a more reliable machine than the XL while maintaining 100% compatibility.

There will also be a luggable 8-bit XE that comes with 128K, a small video screen and a disk drive, the package selling for around $400.

The XE computers will use a new DOS 2.5, which Sam Tramiel said is very similar to the classic DOS 2.0S. The new DOS is necessary so that the XEs

can accept the new 500K 3 1/2" disk drives as well as the current 1050 drive. The built-in BASIC has not been changed.

Hartmann & Tramiel brought up and agreed upon the necessity of exchanging DOS 2.5 for the DOS 3 packaged in hundreds of thousands of new 800XLs sold at Xmas. They were very open to Antic's suggestion that DOS 2.5 be uploaded onto the CompuServe Atari SIG and distributed to users' groups as soon as it's finalized.

Hartmann also proposed that Antic assemble users questions via CompuServe each month and turn them in to him. He promised prompt answers from Atari's top management through Antic. Sam Tramiel was enthusiastic about the arrangement and Antic is starting it right now! Upload your questions for Atari on the Antic Electronic I/O Board and we'll be online with the first round of answers before the end of January.

ANTIC WRITE-INS SAVE PARALLEL BUS!!

Good news that many of us have been waiting for! The XE 128K computer will maintain an open parallel bus for plug-in peripherals. The PBI will even be improved over the current XL format -- with improved timing and a built-in +- 5 volt power amplification.

The last-minute decision to continue the PBI came at an engineering meeting called by Sam Tramiel in response to Antic's write-in campaign on CompuServe's SIG*ATARI.

As for the two new 16-bit machines, they can be described in one word -- phenomenal.

The 130ST is a non-expandable 128K computer and the 520ST carries 512K, that's the only difference between them. They both use the Motorola 68000 chip which is also in the Apple

Macintosh. They both use Digital Research's super-fast Macintosh-like GEM user interface, which sits on top of DR's CP/M 68K operating system.

Each model also has 196K built-in ROM containing GEM and CP/M 68K. An Atari mouse will be available to run GEM's icon menus. Both computers will be capable of running the highly-rated DR version of Logo. C or Pascal will be the development languages of choice.

The state-of-the-art keyboard for the 16-bit machines includes: full selectric-style key layout, 10-key number pad, cursor pad with Help and Undo keys, and 10 function keys. The entire back of the casing is honeycombed with ports, including: parallel and serial interfaces, MIDI musical interface, PBI, etc.

The one sad note at Antic's preview was that the long-rumored AMIE 16-voice sound chip was not totally ready for production yet. The AMIE, which is said to emulate human speech and singing with unprecedented accuracy, will be incorporated into the '85 Atari line later in the spring and will be identified by adding the letter M to 8-bit and l6-bit models that include it.

Another '85 breakthrough is Atari's sleek, compact 3 1/2" disk drive with 500K storage capacity. Sam Tramiel said this drive will be in the incredibly low price range of $100. Tramiel told Antic that the 500K drive, which uses the same sturdy 3 1/2" disks as the Macintosh, will be compatible with both the 16-bit and 8-bit computers.

"We've had long discussions about the issue of disk compatibility," said Tramiel. "But our conclusion is that we're going to strongly encourage software developers to bring out their new programs primarily on 3 1/2" format. At the low price we'll be

selling the new drive for -- frankly 8-bit users would be foolish not to eventually upgrade to a far superior product and format."

However, the current floppy-5 1/4" 1050 disk drive will continue to be manufactured as long as there is a market for it.

In yet another new move, Atari will be showing a wide line of printers and monitors, which will be aggressively marketed for use with IBM and Apple computers as well as Ataris. When asked who was actually manufacturing these new peripherals, Sam Tramiel laughed and said, "Japan Inc."

The Atari printers -- all aggressively low-priced -- will include a 12-cps daisywheel, an 80-cps dot-matrix, and three $50-100 thermal transfer models, including one that prints in color.

The monitors include a 12" monochrome for about $100 -- with a built-in 80-column card for the XE and XL 8-bit series -- and a 14" color monitor for about $200 which will compete with the popular Commodore color unit.

A 640x200 resolution RGB Analog model capable of displaying 512 colors will sell for around $300. There will also be a $150 high-resolution 640x400 monochrome model for the ST series.

Atari also plans to show a monitor with a built-in floppy disk drive, plus a low-cost (around $50) 300-baud modem bundled with software for uploading and downloading.

Software president Hartmann described Atari's goal as "switching from a computer game company to a microcomputer company." He said that Atari Software will primarily publish entertaining and easy-to-use productivity programs. "We'll be very selective about games, only publishing games that we believe have a real

chance to become major hits."

By the day before CES, Hartmann expected to sign the contract for Atari to bring out an integrated program comparable to Lotus 1-2-3 -- but with code so compacted that it will run on 64K. If this deal is finalized in time, Antic Online will upload a description of the product from CES.

Also under development is AtariWriter Plus, which will include integrated mailmerge and spelling checker. It is to all run on one disk at 128K.

Hartmann said he is determined to reach out for user group feedback in the fast-moving software market. He specifically wants major users groups to act as beta testers for new Atari software.

As a first step towards this, Hartmann said he will bring top Atari executives to meet with users' group officers at the special invitational Worldwide Users Network meeting which Antic will host at our offices during the West Coast Computer Fair in March.

Atari Corp. unveils new products and image

Saturday, 5 January 1985

by MICHAEL CIRAOLO, Associate Editor, Antic

Las Vegas--The new Atari Corp. unveiled a new product line and a new image today--all intended to compete with Apple and IBM.

"We are not a game company. We are a microcomputer company," said Sig Hartmann, president of Atari Software, at the Winter Consumer Electronics Show. "We will produce productivity software and educational material."

Atari will now carry complete lines of 8-bit and 16-bit machines, as well as an array of printers, monitors and other peripherals intended for users of Atari, Apple, IBM, Commodore and Texas Instruments equipment.

The XE line of 8-bit personal computers will include a portable 64K machine with built-in 5" monitor and 3-1/2 inch disk drive priced under $400, a 128K computer priced under $200, and a redressed

version of the 800XL priced around $100. All are said to be compatible with existing Atari software.

Two 16-bit computers, the 130ST and 520ST, are based on an 8 MHz MC68000 microprocessor, according to the company's announcement.

Packaged in sleek, low-profile cases similar to the Apple IIc case, thelong-awaited "Jackintosh" Atari ST computers come with 128K RAM or 512K RAM, priced under $400 and $600 respectively.

Today's press conference was introduced by Nevada governor Richard Bryan, who has been negotiating with Atari President Jack Tramiel to establish an Atari semiconductor factory in Nevada.

Negotiations for such an Atari plant are going well, according to Jack Tramiel, but have not been finalized.

Atari will also be actively entering the computer education area, tradionally the domain of Apple, according to Hartmann.

According to Atari, both machines will have 32K bit mapped screens. There will be a choice of three graphics modes: a 320 x 200 pixel, 16 color mode, a 640 x 200 pixel, 4 color mode, and a monochrome 640 x 400 pixel mode.

Atari claims both machines will have a range of 512 colors, with 8 levels each of red, green and blue.

According to the Atari, both computers will have a special sound chip capable of producing controllable frequencies from 30 Hz to super-sonic. There will be three channels, with separate frequency and volume control. Both machines will have interfaces to Musical Instrument Digital Interface.

The central processing units feature 8 32-bit data registers, 8 32-bit address registers, a 16-bit data bus, a 24-bit address bus, according to the Atari.

The operating system uses a graphics kernel developed by Digital Research (Pacific Grove, California), and the Graphics Environment Manager user interface from the same company.

The GEM gives users access to icons, windows, mouse control, a memory management system and a real-time clock.

Atari claims that both machines have a Centronics port, an RS232 port, interfaces for disk controllers, joysticks and mice. In addition, there are apparently four video ports --television, composite video, RGB and high-resolution monochrome.

Accoring to Atari's director of marketing, James Copland, the XE machines will be shipped "as soon as the old 800XLs are out of the pipeline," and the 16-bit computers will be on store shelves by April 1. The company is taking orders now.

Epyx Software teams up with Lucasfilm Games.

Saturday, 5 January 1985

by MICHAEL CIRAOLO, Associate Editor, Antic

Las Vegas--A new partnership was announced today as Epyx Software unveiled two games from Lucasfilm for the Atari

market.

Ballblazer and Rescue on Fractalus, originally developed by Lucasfilm for the old Atari Inc, will now be marketed on 64K disks at a suggested retail price between $29 and $39, according to Epyx marketing director Robert Botch.

Although the two games were just announced, Epyx and Lucasfilm discussed a partnership for several months, signing the final agreement on New Year's Day, Botch said.

Both games were developed over six months ago, and there are numerous bootlegged copies around the country. However, those copies are not final products and differ from the games now being sold, said Botch.

Botch promised that the new partnership will produce further games from Lucasfilm. Two Atari games are currently under development and will be shown in June, he said.

What can we expect next? "All I can say is that they will be in the Lucas style --graphically different from anything currently on the market."

Another report from CES85 by the staff of ANTIC magazine. This file is a report on the GEM operating environment, developed by Digital Research for the new ST line of ATARI computers based upon the MC68000 cpu.

ANTIC ONLINE NEWS
SPECIAL BULLETIN

Permission to reprint or excerpt is granted only if the following credit appears at the top of article:

ANTIC SPECIAL BULLETIN,
REPRINTED BY PERMISSION.
COPYRIGHT 1985, ANTIC PUBLISHING INC.

Sunday, 6 January 1985

by MICHAEL CIRAOLO, Associate Editor, Antic

Las Vegas--Officials from Digital Research Inc. said today their company has signed the first in a series of agreements with the new Atari Corp for DRI's GEM operating system extension.

This move, combined with DRI's commitment to independent software developers, is expected to bring a wide variety of software to the top-of-the-line

Atari computers.

GEM (for Graphics Environment Manager) will run on the Atari ST line of 16-bit microcomputers, which are based on the 68000 microprocessor

Noted for its ability to enable icons, pull-down menus, windows and mice, GEM also simplifies the job of the software developer, according to DRI's Tom Byers.

"Digital Research has taken graphics abilities into the software realm," said Byers. "With the new Atari, the furnishings--the windows, menues and so on-- are included in GEM. The technological barriers to programming are gone."

Digital Research is currently working with about 10 independent software developers now, and will be hosting a seminar in February for about 150 major software developers.

Following next month's seminar, attendees, attendees will be given GEM toolkits to aid in the development of 68000 software.

DRI's development software will allow independent software vendors to write software for the Atari ST machines on any MS-DOS computer.

Thorn EMI/Perfect Software, Chang Labs, Lifetree Software and Matrix have all agreed to write GEM software to take advantage of GEM's user interface, according to DRI officials.

Future software developers can look forward to seminars across the country, toolkits from DRI and one-year access to a toll-free telephone number for immediate technical support.

Because GEM works independently of operating systems and languages, it is compatible with PC-DOS (version 2.0 and up), MS-DOS and Concurrent DOS.

There is no specific development language for the new Ataris, although Byers recommended C.

Part of the GEM package is the Application Environment Services (AES) supplement. AES includes subroutine libraries to monitor and respond to user input from mouse movement, mouse button clicks, keyboard entry and so on.

Libraries also include software that lets a programmer write a menu in text form and have it translated into pull-down menu form, and several storage/retrieval managers to keep track of graphics, icons and the screen under a pulled menu.

Contrary to earlier reports, the ST operating system was developed specifically for the Atari, although it did have its roots in CPM 68000, according to Byers.

Another ANTIC report from CES85.
This report is of special interest
to software developers. Jack
Tramiel comments on the ATARI
philosophy toward software
development support and the new
line in statements before the
Software Publishers Association.

Tramiel opens Atari up to
software artists

Sunday, 6 January 1985

by MICHAEL CIRAOLO, Associate
Editor, Antic

Las Vegas--Atari chief Jack
Tramiel promised the Software
Publishers Association that he
would open Atari up to software
developers.

"I'll open the new Atari machines up the way Apple opened up the Apple II," Tramiel said. "I need your help, and will give you any support you need."

Tramiel promised technical and financial support for those writing software for his new ST line of 16-bit, 68000-based personal computers.

The former head of Commodore also said he would try to put the new ST machines in the hands of software developers by the end of January, three months before the computers are available on retail store shelves.

Software publishers reacted with a wait-and-see, yet warm attitude to Tramiel's announcement.

Tramiel said he was expecting entertainment, business, educational and scientific software.

"We are serving everyone," Tramiel said, stressing that the ST line was a series of personal computers, not home machines.

Tramiel said he would give financial support to "any young man with good ideas who is starting a business. I'll give him some money for the work he's doing for us."

When asked about continued support for the 8-bit XE series, Tramiel told publishers that he would support an entire line of XE computers and peripherals as

long as the consumer continued buying them.

Tramiel said that he had been working with Digital Research for over nine months on the ST design. He stated that Tramiel Technologies Ltd. would have brought the ST series to market, even if he had not bought Atari from Warner Communications. Tramiel said that the sophisticated consumer was "bored with the 6502 technology," and that the ST series was the "most exciting upgrade path" available at the lowest possible price.

At the end of the conference, Tramiel answered a question regarding disk drives with a very surprising quote. "Atari will be introducing a 15 Megabyte hard disk compatible for the ST series for under $400 before June CES."

Is ATARI poised to once again take the computer field by storm. They did it once with superbly engineered highly graphical 6502 machines five years ago. Despite slow initial sales and the name ATARI (games...) the line of machines eventually took off. Today you can't find a better bargain than an Atari 800XL (~$125). Is ATARI going to amaze us once again? I suspect that they will and that their new line of 68000 based machines featuring Digital Research's GEM facility will do very well. After all, Tramail has made business magic before. He can do it again.

With ATARI entering into the fierce battle of the techno-giants we are likely to see a few things occur. For one, I predict that the price of the Apple MAC will plummet considerably. This will, perhaps, delight some and likely frustrate others. Sales may also be impacted although this may be considerably less likely. The new ATARI line, when it is released, will be highly significant and trend setting. Some have said that such actions have stopped within the micrcomputer industry. I don't agree.

ATARI will be able to dazzle the world because it will be bringing out very competively priced 68000 based microcomputers. These machines will feature CP/M 68K by DGI as well as GEM - an operating system independent graphics environment manager based in part, I'm told, on GKS. GEM will be availble for MS-DOS machines as well. You can expect these new machines to be prices in the $500 range with an ample supply of accessories. Jack Tramail was quoted as saying that by the June CES he will release a 15 meg hard drive for the new line priced at $400. Wow! Good overseas buying can do the trick. That's what Tramail is good at. By the way - ATARI is touting its 68000 machines as 16 bit systems rather than Apple's market nonsense of having 32 bit machines. (It is said that ATARI will be the first to have a home based 32 bit machine. It will likely be based on the NS 32032 - who knows for sure, though.) One other neat product due out from ATARI is a voice/music synthesizer that has phenomenal sound capabilites. Mix that with the new line's MIDI interface (pretty amazing, eh?) and you have got a new choice system for high tech musicians.

I've said it before and I'll reiterate it again now. Apple has a great product. It is not, as many think, god's gift to hobbyist or business computing. It nice that there will soon be some strong competition. It will be to the betterment of the consumer. Let's hope a few of the amazing ATARI engineers made it this far and that ATARI really revives itself. As for Apple - let's hope their prices drop and that they continue to do well.

February 1985 TOC ANTIC Magazine
Theme: Money Mastery

page article

14 SYNTEGRATED SOFTWARE
A discussion of the six part business application series from Synapse.

18 HOME LOAN ANALYZER
This is the program that won the APX summer 1983 first prize. Antic is endevoring to keep alive the best of the APX software (see comments below). This program was written by Jim Skinner of AT&T, Information Systems in Orlando, Fl. (are you on the net Jim?)

22 INCOME TAX SPREADSHEET
If you have Synapse's SynCalc, you can use this program to take over the unpleasant duty of preparing your annual income tax return.

26 DRUM SYNTH/BASS SYNTH
This is the most realistic Atari musical instrument simulation that ANTIC said they had ever heard. It includes a tutorial on how to use the AUDCTL memory address.

31 CURRENCY CHANGER
Exchange international money like a seasoned traveler. BASIC program runs on all Atari computers.

33 BEAT THE BEEPS
If you're one of those people who gets irritated by the keyclicks on the Atari 400 and 800, this BASIC program turns off the sound without hardware modifications.

35 SOFTWARE LIBRARY
All the program listings are contained in the center

of the magazine.

56 KOOKY'S QUEST (Game of the Month)
A windowed scrolling maze adventure where you fight monsters while searching for the magic key that's your only escape from a multi-level dungeon. BASIC, 32K disk.

59 COMMUNICATIONS: 200+ Atari BBS List
The biggest and most accurate list of Atari bulletin boards in North America.

63 ASSEMBLY LANGUAGE: S.A.M. Handler
Owners of S.A.M. can use this program to define the voice synthesizer as an I/O device--much like a printer. This allows you to program S.A.M. commands with less typing. BASIC. Need S.A.M. and a disk drive.

66 EDUCATION: Music Flash Cards
A drill program that helps students learn the names of notes on the musical staff. BASIC. All Atari computers.

68 THE TOOLBOX: Parallel Bus Revealed
This is part 2 of a 4 part series on the XL's parallel bus.

72 JACK TRAMIEL DECLARES WAR!
An interview with Jack Tramiel.

74 PRODUCT REVIEW
Software:

Since nobody else jumped in...

> the Commodore '16 colors in hi res' obviously has limitations,
> (only 2 in any 8x8 etc.) The Atari features are different and
> may also have limitations. True, the Atari technically only has
> 2 colors in hi-res, but with proper use of the display list, you
> can have 128 colors (or is it 256?), limited to two different
> shades on any raster line.

In the max-resolution mode (320X200 bit-mapped) the C-64 is as noted.
Since the color data is picked up by the video chip only once every
8 raster lines, there is no way to change it on a per-raster-line basis.
Also, the bit-map is NOT in a logical order.

> With the display list, you can mix
> graphics and text modes on the screen like crazy, ie: a screen
> with 1. four raster lines of hi-res, then 2. a text line, then
> 3. 20 pixel lines at medium res, etc. ad infinitum (or at least
> until the bottom of the screen)

Ditto on the C-64.

> The display list will also
> facilitate scrolling of all or part of the screen either
> horizontally or vertically without moving any of the actual
> data.

The C-64 can do this without display lists. It does require that
the screen be "shrunk" -- 24 lines for vertical smooth scroll,
38 columns for horizontal smooth scroll.

> Display list interrupts can be used to divide the 4 (actually

> 5) players into seperate entities, provided they only move horizontally.
> (actually you might even be able to do vertical movement like this with
> some cute tricks). In this way, each of the 5 players could be divided
> into up to 192 individual horizontal moving 'sprites'. Of course at
> 192, each sprite is 8 horizontal by 1 vertical.

The C-64 has 8 sprites which can be moved vertically as well as
horizontally, each sprite being up to 24 pixels wide by 21 high, with
the ability to "double" pixels in either or both dimensions. "High
res" sprites have only one color each, (the "second" color being
"transparent"), medium-res sprites (where the 24 pixels are made
into 12 double-width pixels) can have 3 colors, one for each
sprite plus two "common" colors shared by all sprites. All of the
things that an Atari display list can do are also applicable to
the C-64.

> Collision detection
> is built in for player-player, player-background, etc. but I suppose
> the Commodore may have this feature.

It does. Also priority -- what is seen when sprites overlap each
other. Sprite 0 always covers sprite 1 ... sprite 6 covers sprite 7.
Normally any sprite covers background, but this can be changed for
any and all sprites.

> I've heard nothing about any
> display-list type features in the C64. If there are any, I'd like to
> hear about them.

The C-64 has a "raster line interrupt" which will produce an interrupt
at any selected raster line. This gives essentially the same facility
as Atari display lists.

While this all sounds very impressive on the C-64 side, I feel obliged
to point out that "features" and "quality" don't necessarily go
together. The quality of the video that the C-64 presents is
terrible. The only way to get a watchable picture is to use the
Commodore monitor.

> I don't know much about the C64 except it has 32 sprites. I guess it
> just uses the T.I. 9918? (no display list or associated interrupts).

Only 8 sprites. It uses the MOS Techonology (a division of Commodore)
6567 VIC-II video chip.

> All I know about the sound generators is what was said in the above
> referenced article.

The sound synthesizers in the C-64 really are the best there is. If
sound is what matters to you, you needn't look farther.

Er, um, say folks, but has it occurred to anybody that all of
the great announcements from Atari are a smokescreen to cover
up their financial troubles?

ANYBODY can announce anything they dang please. I think I'll
announce a system based on a VAX 11/780, with 2048X2048 pixels
in 16 million colors, voice response and speech synthesis,
priced at $49.95, to be available later this year. Wow!
What a deal!

The indications are that Atari will be in bankruptcy court very
soon. Whether they avoid it or not, a reasonable observer would
have to ask "Where are they going to get the money to design
these great and wonderful machines, when they can't pay the
bills they've already got?"

Talk is cheap. It's all that Atari can afford right now.

x
The InfoWorld article came pretty close. Here is what Atari's marketing manager,
Bryan Kerr, described
during and after the Las Vegas Consumer Electronics Show:

Atari's new ST line is based on the 68000 chip, running at 8 megahertz.
The 130ST will have 128K and sell for $399. The 520ST will have 512K, $599.
If there is demand, there may be an in-between model, the 260ST.
These machines will use external Sony 3 1/2-inch drives, priced at about $150
each. The computers will have build-in interfaces for floppy disk AND hard disk.
 The hard disk is due later in the year, 10 megabytes, $600.
The operating system was developed jointly by Atari and Digital Research and
is stored with DR's Graphics Environment Manager in 192K of ROM.

The new low-end machines are the 65XE, a replacement for the 800XL, the 130XE
with 128K and the 65XEP, a portable with a small CRT screen.

If Atari can deliver the goods, this should be an interesting year.

A recent article discussing telecommunications with the ATARI listed
several terminal emulation programs including "Chameleon 4.0". I
have used Chameleon 2.0 for more than a year now and find it the best
program for talking to Unix. It was available from APX and included
the executable plus macro source. Version 2.0 handles 80 columns by
providing horizontal screen scrolling (a mixed blessing) and provides
a reasonable emulation of a DEC VT52 or ADM 3A which makes using vi
easy. It also provides a simple text-file upload/download capability.
The description of Chameleon 4.0 really caused me to drool--it has all
the enhancements I've been wanting including XMODEM and KERMIT file
transfer protocols, disk management functions, and support for
smart modems.

My problem is simply that the article gave no clue as to where I
could get Chameleon 4.0. The article simply stated "[it] is a popular
terminal program in the public domain ..." If anyone knows where I
can get the program (preferably with the source), I would really
appreciate it if you would send mail letting me know where!!

there have been references to the Atari 130ST for $299 on the net,
but i don't think i've yet seen mention of the 520ST (with 512K RAM)
which, as i recall, will come in around $599. the printers are from
$150 and up, and the disk drives (3 1/2" floppy or hard) also from
$150 and up. color and hi-res monochrome monitors will also be available.
perhaps someone who actually went to CES can correct my figures in case
my recall of what i heard 3rd or 4th hand is inaccurate.
     GEM and the CP/M-68k derived TOS are in 192K ROM. interesting thing
about this architecture is that it does admit cloning, something much more
difficult to achieve with the Mac (due to proprietary OS).
     speculation about the unit to be revealed at Hanover will probably
continue to vacillate between 32032 and 68020. National people are saying
the 32032, but then again there's what we're hearing ...
     home UNIX? quite possibly with the 520ST or the next model. in the
mean time, there is HP's Integral PC, a portable UNIX machine for $5K.

     p.s. it's the 6809, not the 6509, that comes from Motorola's 6800 family.

Atari has apparantly sold 600,000 800xl's since the price cut, which is
how J.T. is financing development.

>Er, um, say folks, but has it occurred to anybody that all of
>the great announcements from Atari are a smokescreen to cover
>up their financial troubles?

This is certainly a possibility. However, I don't think Jack
Tramiel took over Atari to preside over a Chapter 11 bankruptcy.
I think he will at least try to make a go of it with his new
68000 machine.

>ANYBODY can announce anything they dang please. I think I'll
>announce a system based on a VAX 11/780, with 2048X2048 pixels
>in 16 million colors, voice response and speech synthesis,
>priced at $49.95, to be available later this year. Wow!
>What a deal!

From what I understand Atari has actually shown the machines at
the winter ces. Of course it would be better if someone posted
a review based on hands on experience. Based on the specs that
were posted I certainly think it is possible to design such a
machine. After all a 68000 doesn't cost that much these days and
atari is buying them in volume. I certainly hope atari gets a
chance to market these machines as it will introduce some much
needed competition into the home computer industry.

The new version of the old favorite is not in the public
domain. But, read the latest issue of Antic magazine. In
it there is a small catalog of software that is available
from them that used to be from the now defunct APX. They
have made arrangements with several of the old APX authors
to market their stuff. Among them is Chameleon 4.2. It may
be order from them by calling thier toll free number and
asking for #AP113. It is priced at $19.95 + $3.00 s&h.
The number is 1-800-227-1617 Ext. 133. The catalog is
included in the magazine by subscription only and is not
in the ones available by single copy in the stores, so as
a service I will post the entire catalog, if there is any
interest. Let me know either by post or mail if you would
like it posted on a regular basis.

I think that are probably wrong. I read last week that Jack T was seeking
50 million in financing. Apparently the machines has already been designed.
If he managed to find cheap labor and facilities abroad he can likely
begin production. Let's give him a chance. It is far better to encourage
people in their business/financial endeavors than to label them
failures before startings. I hope the ATARI company succeeds.

Re: talk is cheap

I spoke to a local dealer on Friday who was at CES. He said that Atari
was showing a functioning model of the 68000 machine *and* letting
people touch it and mess around. Atari does have a little more than
just talk going for them. It remains to be seen whether they can do
it at the stated prices, but they have done it in prototype!

I for one hope they can do it. As announced it will be an amazing home
machine. I have one of their glossy handouts -- highlights are:

- 68000 based with 128 or 512K (C$500 and C$700 respectively)
- GEM graphics system (apparently similar to a colour Mac)
- 3 graphics modes - 320x200x16 colour
                   - 640x200x4 colour
                   - 640x400 monochrome
                   - output to tv, composite or RGB monitor
- built in interfaces for hard and floppy disks
- 1 each, serial and parallel ports
- mouse (standard equipment)
- 3 voice music synthesizer plus MIDI interface

All of the above are on their list of *standard* features!

I bought the February issue of Antic at a local computer store, not with a subscription, and it did indeed include the APX catalog, so you may want to save yourself some typing.

There is a terminal emulator for the ATARI that was written by John Palevich (Chameleon author) and that apparently is in the public domain. It supports the KERMIT protocol, the Hayes Smartmodem, the Atari 1030 modem, and has smooth horizontal scrolling (which is NOT automatic). It emulates the VT52. I have successfully used this with vi on UN*X and for transferring files (at 1200 baud) between the Atari and KERMIT running on a UN*X system, and (at 9600 baud) between the Atari and a DEC Rainbow running KERMIT.

This program is written in ACTION!, so you need the ACTION! cartridge. It works beautifully, and is an outstanding example of an ACTION! program. (Yes, it is in source code form.)

I got it from a DEC public access system in MA. FYI, this is how to contact the DEC system. Note that it only supports KERMIT file transfers, but the files you need are all ASCII. The files all start with "ATA", and they are in the KERMIT: directory, so you can see them by typing "TYPE KERMIT:ATA*.*" (or something similar - on-line help is available).

To get onto DEC's market machine, phone (617) 467-7437 Once you get a connection, (1200 or 300 baud) type control-C twice. This enables auto-baud. then:

LCG LCG-KERMIT KERMIT

This gets you on. The system is primarily a KERMIT system, but it has MS-DOS and CP/M areas from which files can be downloaded using KERMIT.

BTW, also in the APX catalog is a disk full of ACTION! utilities, though they don't describe what exactly is on it.

CES-ATARI FINAL WRAP-UP

by NAT FRIEDLAND, Antic Editor

LAS VEGAS - The January 1985 CES show looked like the arrival of vindication for those who believed in the Atari Computer. The spectacular hardware and software shown at the crowded Atari exhibit was clearly superior and dramatically lower priced than anything brought by Commodore or the Japanese MSX contingent.

Model numbers - and to some extent, prices - still seem to be in a state of flux. But here is the best information ANTIC has as of now.

16-BIT COMPUTERS - The 130ST (128K) is $399. A suddenly announced 260ST (256K) will be $499. And the top of the line 520ST (512K) is $599. The ST operating environment, GEM by Digital Research, will make it easy for software developers to transport programs originally written for the Macintosh and IBM PC environments.

8-BIT COMPUTERS - The 65XE which replaces the 800XL will continue at under $120. The 130XE is "well under $200" - or approaching $150. We also had our first look at the 65XEP luggable, under $400, including a 3 1/2" disk drive and a very clear 5" green monitor. These computers are all compatible with Atari's earlier 8-bits. When the polyphonic AMIE sound chip is finished around March, it's supposed to go into an alternate 64K machine to be called the 65XEM.

DELIVERY DATES for everything in this story is supposed to fall between 30 days and the start of the second quarter.

PRINTERS - $150 for the slow (12 cps) but true letter-quality daisywheel, $150 for the 80 cps dot matrix that produces graphics virtually as sharp as the Apple Imagewriter.
$150 for the 50 cps non-impact color printer that produces very clear text,

and $99 for a black-only 20-cps non-impact model. All of these printers seem much sturdier and more professional than any printer that has ever carried the Atari name. They all work with both the 8-bit and the 16-bit lines, under different interfaces and model numbers.

In fact, Atari printers and monitors will now be marketed for IBM, Apple and Commodore computers, under the Atarisoft name.

MONITORS - The XC1411 composite color 14" is under $200. The XM128, about $150, is the crisp 12" green monitor with built-in 80-column card that works with the new Atari software on XE computers. Specifically for the 16-bit ST line is the very impressive 12" RGB analog color monitor, SC1224 under $300, that's capable of showing 512 colors onscreen. You can also get this model with a built-in 3 1/2" disk drive attachment. And there's an extra high resolution monochrome monitor, the SM124, for the STs at under $200.

The Atari exhibit area featured a wall of color monitors, which often displayed the spectacular graphics demos which Atari has been making available to users groups. Doug Crockford's BALL1 has been put on CompuServe by ANTIC. And Jim St. Louis' & Russ Karas' animated high-res robot and rocket ship are starting to be seen nationwide.

DISK DRIVES - The 500K SF354 3 1/2" drive is under $200. And they are now also talking about a 250K 3 1/2" drive, the SF324, for around $150. Not yet shown was the under-$600 SH317 hard disk with 10MB, and there's also some discussion of a 15MB hard disk. Speed of all these new drives is announced as a phenomenal 1.3 megabytes per second for the STs. For the XEs they're hoping to boost the speed to 30,000 from the current 19,200.

The 1050 disk drive will be gradually replaced for 5 1/4" floppies by the compatible XF521, around $150, which

has true double density and matches the new XE look. The new compatible Disk Operating System 2.5 was developed by Bill Wilkinson of OSS, the father of Atari DOS.

TELECOMMUNICATIONS - The $49.95 XM301 direct-connect 300-baud modem is slightly larger than a cigarette pack and comes bundled with software for uploading and downloading. The long-awaited Learning Phone cartridge for accessing Plato was featured, in-store availability should begin in February and the price may be as low as $25. The Plato cartridge was also being demonstrated with MPP's new low-cost 1,200-baud modem.

CES-ATARI FINAL WRAP-UP

by NAT FRIEDLAND, Antic Editor

SOFTWARE BREAKTHROUGHS

LAS VEGAS-

Atari's CES software was in its own right as spectacular as the hardware breakthroughs on display. The star attraction was undoubtedly INFINITY - which is the next generation of sleek, powerful integrated programs.

Infinity has specs that are more than a match for Lotus 1-2-3 and Symphony. Yet it can run in as little as 64K (even on the old 800) with only the loss of a few extra features. And incredibly, it will be sold at only $49.95 for 8-bit Ataris, the 16-bit version will be about $70.

The Tramiel Atari Corp. has shown that it is serious about holding software prices to $49.95, which is what virtually all the advanced productivity software described in this article will cost.

I realize that Infinity sounds almost too good to be true. But Antic has seen it in operation. On one disk it contains a spreadsheet, relational database, a word processor that looks like MacWrite, a telecommunications package, graphics, icons and pull-down menus, and integrated printing. It runs in virtual memory, which means that file size is more dependent on disk capacity than on RAM.

Infinity will support the upcoming Atari local area networking (LAN) capability. And it includes multitasking -- up to 6 simultaneous operations on the ST series, 3 on the 130 XE and 2 on the 65XE.

Vincent Garafolo of Cambridge's Matrix Software, developers of Infinity, explained that they were able to get so much into a 64K memory program by

two-step "optimizing" of the assembly language compilation. This procedure is usually only used in advanced military and government software.

"Most software companies don't do optimization because it's so tedious, even though it's possible to drastically reduce the size of most programs," explained Garafolo. "You don't have to be a programming genius to optimize. You just have to be willing to put in a few hundred hours of boring, painstaking line-by-line analysis."

Other impressive new software from Atari includes Silent Butler, a personal finance program that balances multiple checking and credit card accounts, and tracks tax deductions. It's most unique feature is the ability to print on your own personalized checks, using a plastic check-holder that fits into your printer.

Shopkeeper is an easy-to-use small business accounting package that also tracks inventory and generally emulates an electronic cash register. It also compiles daily reports which will be automatically transferable to the upcoming (2nd quarter) general ledger module. There will be six modules in the series.

Song Painter is a very user-friendly music construction program that replaces standard musical notation with self-explanatory colored line patterns and icons. Its three instrumental voices can be controlled almost entirely from the joystick.

In another Atari musical development, the in/out MIDI ports on the ST computers were being demonstrated driving the new Casio CZ101 $499 synthesizer.

Hi,

 You are reffering to Atari Kermit written in Action! Chameleon
supports Modem protocol as well and was written By John Palevich
in assembly language using a cross compiler on a PC.

 He can be contacted at 175 Calvert Drive #F211

Cupertino, CA 95014

I believe he is at hplabs somewhere out there and probably is reachable
on the net. He is very helpful and has even sent me some of the sources
to his Kermit code.

Eric

Now that we have a fairly good idea of the features and price
of the new 68000 atari machines, we can compare them and see
if it will put some price pressure on the mac.

The basic mac has a 512x342 bitmapped display,internal disk
drive and 128k plus a mouse and a couple of high speed serial
ports and an applebus local network interface. The lowest
advertised price I have seen is about $1400 for this basic
configuration. There are also rumors that apple may drop
this by another few hundred dollars so we can assume that the
price will be around $1200 by the time atari ships it's
machines. The 512k upgrade is about $1000.

The equivalent atari configuration would be the basic
machine + mouse for $500 plus $200 for a disk drive and
another $150 for a high res monochrome monitor, for a total
of $850. The atari has a little higher resolution 640x400.
I am assuming the most common configuration is with a
monochrome monitor.

So the mac will be about $350 more than a similarly configured
atari. This is not such a huge difference and probably won't
force apple to lower it's price as it can claim a "large"
software base and a machine that is of professional quality
with support vs atari's marketing it to zero support people
like kmart and toys r us. However, the 512k upgrade will
probably be much cheaper since atari's is only $200 more than
the base machine. Whether apple could maintain this position
depends solely on the quality or percieved quality of atari's
machine. A repeat of commodore's problem with the c64 would
probably spell disaster. If atari can grab a reasonable
market share I think they can only get better since they
have a few additional features such as color, a fast hard
disk interface with dma, no wait state memory at 8Mhz vs
the equivalent 4Mhz for apple because of display refreshing,
3 voice synthesizer that will eventually be upgraded to
16 independent voices and a midi interface. Of course apple
won't be sitting idly by, but it should make for an interesting
year with commodore jumping into the fray with their amiga
machine later in the year. Atari has another machine in the
works using the (rumored) 32032 that would bring the equivalent
of a sun workstation to the home. If that really happened
the entire micro market would be thrown into confusion.

I've been reading all these comparisons and I own a c64.
I think that straight comparison is out, there are too many
basic differances.

For a start the Atari machines have a display processor of sorts,
that make the video very powerful, but the c64 has a versatile
video controller that can tell the processor when to do things,
via the raster interrupt, and thus if you wanted
you could change video modes on every line also.
This uses a lot of main processor time if used in many screen locations
but can be used to give many effects not available using the display
file on an Atari,for example a one line pixel scrolling message anywhere
on the screen.
The disk interface speed in now effectively cured, with small
alternative loaders. It now takes about 20sec to load 32k instead of
1min30sec that it takes normally, since Atari use serial interfacing
as well, I would assume that their disk speed is slower than this.
As for memory, I can't compare the XL machines with the c64 since
I'm not sure of the facts, but almost all commercial software is capable
of access to the entire 64k of memory.
Sound, the Atari relies on fixed oscillators with which one can only
make beeping noises (directly), the c64 has a synth which does more
than most other people mentioned. For a start you have a choice of wave-
form on all voices, this is for harmonic control. Triangle waves produce
the least harmonics and sound more like most wind instruments,
Sawtooth are very quite high up in harmonics, and pulse wave forms
are like most other micro beeps except you can change the step/mark
ratio. Finally there is the white noise generator, this is just another
optional wave form, so can be used on all voices(unlike what others
said). Next are the filters, there are digitally controlled
high,low and band pass filters which can be used to make tinny
sounds or bass sounds or whatever. Other features include
ring modulation, hard sync., envelope shaping, A to D converter
on voice 3, plus much more. I have heard very good speach synthesis
on the c64 with no extra hard-ware(it really sounds like a person.)
Graphics are next, the Atari highest mode is higher than that of
the c64 I think, but what makes graphics in games is colour.
The Atari is lousy at having a good range of colour on the screen
at once, with careful planning on a c64 there is no reason
why you can't use all 16 colours where you want when you want them,
i.e. no trouble getting more than 2 colours on one raster line.
The Atari sprites appear to be very limited too, why would one
want a sprite filling the whole screen? Admittedly there are only
8 sprites on the c64, but with the raster interrupts running
then any number can be used, and they CAN move in both directions.
Software, this is where my favorite machine starts looking a
little low, unfortunately where there are the same games on both
the Atari and the c64 the c64 looks worse off, I can see no real
reason why this is so, but I can only guess by saying that all of it
was originally written on the Atari and then made to work on the c64.
Thus when it designed all the graphics etc. were made to fit the Atari
in particular and it was hard to move. Where software was made for
the c64 (see Impossible Mission or Space Taxi) the quality is the
best.
In the case of support all I can say is that in England, where I live,
Atari seems to have vanished, and there appears to be no support whatever
despite all the Net News saying the 800XL is only about $120 over in

America.

Dave (Maths @ Warwick University, UK)

P.S. These views are probably very biased. Who cares, flame me, I love
seeing pages of mail to me, etc..

A few points I missed:-

Commodore use their own video controller.
Interrupts are a major feature in the video (raster,collision etc.)
There is collision checking,(background and foreground plus a possible
foreground colour that is transparent for collisions).
The sound chip (SID) has a (maybe more) 4 bit D to A output also.
It also has an input that gets filtered if you desire (i.e. tape).
I have had 48 24*21 sprites on the screen at the same time.
The c64 has three Forth compilers available at my last count, plus
one full Pascal implementation.

Dave.

[included quotes follow my comments]

I also hope that Atari succeeds. But it's one thing to hope, and
something else again to (as a bunch of people have) get terribly
excited about wild announcements from a company that is in deep
financial trouble.

Especially when that company is headed by Jack Tramiel. In the years
that Tramiel ran Commodore, Commodore announced a ton of new machines
ranging from the Max-Machine super-video-game to a Z-8000 based
Unix machine. They demonstrated prototypes of all of these at
the time of announcement. The only one they ever produced was
the SX-64 "portable C-64". And Commodore was even making money!

By the way, "seeking 50 million in financing" is not the same as
"getting 50 million in financing". And Tramiel would never seek
any outside financing if he had any choice.

We can all hope for Atari's recovery, but in the meantime I intend
to keep my feet on the ground and not get excited about new computers
until AFTER they're on the dealer's shelves. There'll be plenty
of time then.

--- Quotes:

This message is directed to all owners of Indus disk drives.
I bought my drive almost a year ago, and only received 2 out of the 3
promised programs. A friend of mine bought one even earlier, and only
had one of them included. After filling out the warranty card (which
promised delivery of programs when available), we have heard nothing from
Indus. We have heard from other sources that the third program is now
available.
My question is this: has anyone heard about the promised SynchroMesh,
which would speed up the functioning of the drive?
Any information on this topic would be much appreciated.

Jerry Zarycky

Lines: 20

I recently submitted login instructions for the DEC public access
TOPS-20 machine in MA; however, there were two typos in the
the login sequence that prevented successful login. Here is the corrected
version:

To get onto DEC's market machine, phone (617) 467-7437
Once you get a connection, (1200 or 300 baud)
type control-C twice. This enables auto-baud.
then:
     LOG LCG.KERMIT KERMIT

This gets you on. The system is primarily a KERMIT system, but it
has MS-DOS and CP/M areas from which files can be downloaded using KERMIT.

Thanks to Ken Dye (pur-ee!dye) for bringing this to my attention.

[go ahead bug, make my day]

Some notes on the 'possibility' of Atari marketing those new machines.

1. Atari has been talking to National for years about the 32000. When I was talking to National, there was always this one particular company in California who was going to produce a consumer machine based on the 32000. Of course they could not tell me who it was, but it couldn't have been Apple and they said (indirectly) it wasn't IBM sooo..... This doesn't mean Atari couldn't use the 68020. That's the neat thing about the 32-bit processors. If you have a C compiler, they're all alike.

2. A hard disk for $400 is quite reasonable. Just because the IBM crowd wants a minimum $1000 for a 10Mb disk doesn't mean that represents a reasonable markup. We were able to buy a 10Mb disk (drive+drive electronics only) for $300 in quantity one. If you want to talk about volumes of 500K units/year I bet the price gets even lower. Also, the consumer industry operates on a relatively narrow markup over factory cost.

Apple can sell Macintoshes to the universities for $1000. You can bet they aren't selling at a loss. The Atari's don't have an expensive high quality CRT included either, so they should be cheaper. The pricing is reasonable, assuming a high volume product.

3. What design to finance? They bought the OS from DRI. No development there. I bet they could even get DRI to do the port for them (wouldn't you, for the kind of volume they could deliver? Remember, this is the product that could make CP/M-68K and GEM household words.) Designing the PCB's is not that big a deal, the plastic case couldn't cost more than $5 million if it was the most intricate possible design. Fancy gate arrays have design times of a couple of man months and the production cost for prototypes is really negligable for a company of Atari's size. The only thing that could get expensive is VLSI for things like fancy video and sound chips. These designs may have been proceeding for some time now (it is pretty clear they have been) so unless Atari goes belly-up this morning they will not be affected.

Besides, remember Traniel fired most of the staff when he took over. The engineering design may have been nearly complete when he came in. All Atari has to worry about is keeping their current products profitable (even in bankruptcy, the creditors won't close him down if it looks like he has turned the corner and might pay them back).

No, I think this product is coming. I can hardly wait.

ATARI PRICE UPDATE!!!!

In the Sunday edition of the Trenton Times (NJ), the following adds and prices were seen:

800XL -- $130.00 !! Kiddie-City Stores
Koala Pad w/ Software -- ~$50.00 Clover Stores

I have also heard (at an Atari user group meeting) that a 1050 Disk drive can be had for ~$180.00.

Just passing info on,

Mark Nigh

Child World in Hazlet,NJ and Eatontown, NJ advertised in a 11/11/84 paper:

     800XL $119.95
     1050 $179.95
At the JACG club meeting Saturday, 11/10/84, an Atari dealer in Cedar Knolls
advertised in a printed handout:
     800XL $129.95
     1050 $179.95
An "electronics" store in Woodbridge Mall (NJ) was observed on 11/11/84 with:
     800XL $129.95
These seem to be the new prices, not just one day only sale prices!!

The Cedar Knolls dealer advertised a modification kit for the 1050 that
add true double density capability, and a claimed three times speed up in
transfer rate. I have forgotten the manufacturer. Has anybody had any
experience with such a modification??

I have this atari 600XL which I use to play video games. The
long awaited game that I always wanted Flight Simulator II by
SubLogic) finally came out but I also found that I could not
play it on the 600XL since it requires 48K of memory.

I tried to find an extended memory module for the 600XL but
couldn't find it anywhere.

Questions: [1] What is the maximum limit of how much
            memory I can add to the 600XL?

        [2] Where can I find/buy an extended memory
            module?

I couldn't get any info in the San Jose/Sunnyvale area. I even

called the current atari service number but for six hours I tried,
the phone was always busy, and the atari operator told me that they
are always that busy.

Thanks in advance.

            I don't know who is being replied to here, as I missed the
initial question, but I have to agree with keithd at cadovax on the Indus
G.T.. I have one with my old time Atari 800, and am completely pleased with
its performance. It reads and writes fast, and has a lot of neat little
extra features. There is only one complaint I have, and I have been told
that mine is a common problem. A couple of the LED's on the track display
flicker or go out completely often for long periods of time. Fortunately,
the ones that go out normally do not prevent you from reading the display,
but it is an annoyance. With the quality of most consumer products these days,
though, I don't let that worry me. I still highly recommend the Indus. If you
can afford the ATR-8000, I might recommend that also, but that's a different
story. I now regret the loss of all that wonderful CP/M software that I could
have had, so if you consider CP/M an important option, and don't mind the cost
and trouble, consider ATR too. Let me emphasize, however, that Indus is a
first-rate drive. Have fun.

[Greetings from your Selective Service Board ....]

Yesterday an AP article about Jack Tramiel and Atari
appeared in the paper which stated that the list price of
the 800XL will be reduced to $120! If the WSJ is correct
(posting courtesy of Kit Kimes) that leaves a $15 margin
to retailers. (Even so, like wow, man. :-)

There were also some really great quotes from Tramiel:

  "Business is war." (My favorite.)

  "I came back in business in May because I felt that this
   business was becoming very dull. Everybody was sitting and
   trying to get as much money as they could. There was no
   reduction in prices and no improvement in technology."

  "Anybody who sells computers is a competitor."

Tramiel confirmed that Atari will announce an 8 and 16 bit
computer in the first quarter of 1985. (Note that "computer"
is singular -- a 65816 based machine maybe?) A 32 bit machine
will be announced in second quarter 1985. Both will sell
under $1000.

In today's NY Times (11/15) Atari has a full-page ad announcing the new
price of the 800XL to be $119.95. Also, in Tuesday's Science Times
section, which tends to run numerous computer store ads, an outfit
called Harmony Video in Bklyn was advertising 1050's for under $150.
(I think the exact price was $139.) They have a toll-free line for
anyone interested.

Now, the big question is, is Trammiel just clearing the shelves before
discontinuing the line altogether, or is this a revenge move against
Commodore for Xmas?

I'm a new Atari user and would appreciate any feedback on:

1. Would like to convert my CRT (Sakata SC-100) to 80 column format, at as low a cost as possible. I also own: 800XL, 1050 drive and 1027 printer.

2. I have experienced enough occurrences of "keyboard lock-up", that I'm considering buying Atari's new version C of BASIC. I would like to he from those who have tryed BASIC-C to find out if the "keyboard lock-up" problem is eliminated and are there any new problems.

Thanks in advance!!!

[]

Several people have commented on the new Atari prices, although even the

Wall Street Journal confirms these to be the new regular prices, not just a one time deal.

As for future products, several sources, including the WSJ states that Atari will announce 2 new variations for the 800XL. One will have 128K of memory built in, using bank switching.

Atari will also have a 16 bit and a 32 bit machine next year. The 800XL's and the 16 bit machine should be shown at the Winter CES in January. The 32 bit machine might be announced but probably won't be available until late spring or summer. The big machines will use a new operating system called TOS (Tramiel Operating System) that has been developed by the same company that developed MDOS.

In other news, Bill Wilkinson (of OSS fame), in his regular Atari column in December COMPUTE!, passes on some interesting information. It seems that Microbits is developing both a parallel floppy disk drive and a hard disk system for the 800XL. It can not be used with the older systems since it takes advantage of bus out the back. Preliminary speed measurements indicate that you may be able to read/write over 40K bytes per second to and from the disk. This would certainly make playing graphics adventure games tolerable! No announced delivery date yet because development work isn't finished. It appears, though, that both hardware and software manufacturers are developing renewed confidence in Atari, so we should see even more exciting announcements next year.

Happy Computing..

*** REPLACE THIS LINE WITH YOUR MESSAGE ***

With the 800XL so cheap, I want to use one as a terminal going via
modem (1200b) to a UNIX (tm) system. Is there a good 80col. terminal
emulator available which makes the XL look like some identifiable
terminal. I would alternatively accept a unique terminal program if
the documentation told what codes the XL sends for given conditions so
that I can write a termcap for it.

Please give me the source (if possible) as well as the item descriptions.
I will summarize to the net.

You buy alot of software to do things for your kids on the Atari.
However, you might consider going to the library and getting copies
of Compute or some other magazine that supports Atari. These
magazines have alot of low level programs for education. The fun
thing is to work on the program yourself and have the kid there to

work with you some. I found that I and my kids have had some good
times doing this.
****

I know you didn't ask for advice, but ...

Wait for your son's bar mitzvah to give him computer stuff; let him enjoy
his childhood.
Get him a boxful of puzzles (the old-fashioned wooden kind) better. He can
share them with his friends and learn some social skills; that will serve
him better than the little he'd learn from any 'educational' program.

[Computer literacy is a great big crock, anyway. By the time your son grows

up enough to really need a computer, it won't look like a computer - if it does
it won't do anything useful.].

I may have flamed a little here, but I am serious in the gist of it.

Thank you for listening.

****

My son is 3 like yours (born in 8/81). He knows the letters
and numbers (from Sesame Street no doubt).

I have Kindercomp and Facemaker from Spinnaker and My
Letters, Words and Numbers from Stone. Kindercomp is OK,
none of the games are outstanding, but there are 6 of them,
so it's an overall good value. Facemaker I think is a
little too rigid, but an older child might enjoy the
guessing game part (it's like the game Simon of years gone
by). MLWN is basically introduction to the keyboard with a
cute animated graphic (one for each letter of the alphabet).
I enjoyed it, but it grew stale fairly quickly, though it
did teach my son the keyboard.

I'd be interested in other replies you get.

I am trying to use an 800XL as a terminal using the APX program
"Chameleon" and an R: handler from AID ("R-verter") to communicate
through a Rixon 212 modem. The software commmunicates perfectly with
the Rixon, dials the Unix system I work on, but when I establish
contact with the remote system I no longer get CR with LF and the
screen switches back and forth between normal and reverse video.
In addition, all control characters print rather than execute.

Does anyone have experience with the "chameleon" terminal emulation
package? Do I have to buy an Atari 850 interface to make it work.
(Will it work if I get one).

Does anyone have an alternative terminal emulation package for this
combination?

Thanks

     Recently I have seen Atari 800XL's as low as $120.00.
Does anyone know if you can play the Atari 2600 (the original Atari
game machine) cartridges on the 800XL??
I am thinking of buying one for my sister's family as they already have
an 2600, and would like to know if they can still use the old cartridges
on the new 800XL.
If the cartridges don't work, is there anyway to make them work.
I am assumming that both the 2600 and the 800XL use the same
microprocessor, and are otherwise compatiable.
Please respond via EMAIL unless of general interest to the network.

The 400/800 (XL) series generate their graphics in an entirely different
manner. 2600 games are designed with primitive graphics in mind, while the
800 series machines are truly graphics oriented. You'll find that they are
not in the least bit compatible. Atari 5200 games on the other hand, are
almost identical to 800 games (because the machines are almost identical).

>Speaking of touch tablets. Does anyone know how easy/practical
>it would be to connect a touch pad made for an Atari to a serial
>or parallel port of another computer?

>   Harold Ravlin

The output of these type of touch tablets is X and Y analog voltages,
(0-5v I think) which require any system that it's connected to to have
some sort of A/D converter. Given this, connection may be relativlely
simple. A serial or parallel port is of no use, unless an A/D converter
is connected between one and the tablet, which will require some amount
of hardware hacking.

I am contemplating purchasing a computer for my son this Christmas.
With the $120 price tag, the Atari 800XL sounds pretty good, but
I still wonder how it compares to the Commodore. It seems like
there is more software out there for the latter.

How do they compare? Is the graphics better on the Atari? Games
are important. Are the games on Atari comparable to the Commodore?
Is the disk drive for the Atari just as clutzy as the 1541?
I guess the above questions can by grouped together as one: Is the
Commodore worth the $80 price differential?

I've used Chameleon before, but with an 800 (sans XL) and 850 box.
It worked exactly as advertised, right out of the proverbial box.
There were one or two things I didn't like about it, though, so

I uploaded the source to UNIX, changed it to my liking, and ran
it through our cross-assembler. My main gripe was the silly
BASIC preamble. I replaced it with an assembler routine.
Perhaps I have an older version, though. I didn't keep up with
whether or not he put out another version when he went to work
for Atari (boy I'll bet he was pissed at getting laid off).

When you say:

> In addition, all control characters print rather than execute.

That doesn't sound like any Chameleon I had. Mine (the original,
not my modified version), passes all characters through and uses
the OPTION, SELECT, and START keys for the functions it provides.

    I heard rumours at the Canadian Computer Show that atari is coming
    out with five new machines in january. Three of them will be along
    the line of the 800XL (one the same as the 800, except different
    colour, another like the 800XL but with a better sound chip, and the
    third one is a 128k version). The other two machines are supposedly
    Mac like (colour and mouse, I doubt that a monitor is included) and
    run an OS by Digital Research... There are two versions: a 128k
    version and a 512k version. The 128k one is supposed to retail for
    ~$550 Cdn. and the 512k for about $650 Cdn. (somewhat hard to believe)

    It should be interesting to see what they finally come out with...

I recently purchased an Atari 1050 with DOS 3, and would like to convert
a program (Disk Tool: ANALOG Magazine #8,9) that allows you to read DOS 2
disk sectors directly. However DOS 3 is much different in the layout of
sectors and information on the disk medium.

So far I've determined that:
1. sectors are grouped into blocks of 8
2. directory is at block 2 (sector 16)
3. each directory entry is 16 bytes long per file
   0 = Status, 1-8 = filename, 9-11 = extension,
   12 = size in blocks, 13 = start block (+3 sectors for boot/directory)
   14,15 = ??? (file size perhaps)
4. in status of directory bit 0 = file deleted, and bit 1 = file protected
5. no linking of sectors, everything is sequental in blocks, perhaps blocks
   are linked

Anyway the question is: does anyone have more information of the structure
used by DOS 3, what the bits in the Status and the last two bytes of a
directory entry means. Also any other useful information would be appreciated.

                        Thanks,
                        Owen Alexander !houxl!oaa

In Los Angeles, California, USA:

ATARI/AMDEK COMPUTER STUFF FOR SALE (SPORADICALLY USED)
ASKING PRICE = $500

- Atari 800 computer with 48K, 4 voices, and more than 16 colors
  (Any music composers or aspiring animation developers out there?)
- Atari 810 disk drive & controller
- 10 diskettes, suitable for the Atari 810 disk drive
- Amdek Color I Monitor (supports audio & full Atari graphics)
- Low-budget assembled desk
- Atari 410 cassette unit (supports audio as well as data)
- 1 Atari joystick and 1 high quality joystick
- Atari paddles
- Atari Assembler/Editor cartridge + documentation
- Atari Basic cartridge + documentation
- Microsoft Basic + documentation
- Several game cartridges and diskettes

   o Atari DOS user-level documentation
   o Technical reference specifications of:
      - Atari DOS, including internal/hidden functions, memory locations
      - Hardware details down to the chip/signal level
   o Full and accurate assembler language listings of Atari DOS
   o 6502 machine language reference manual

From the Soap Box of Clancy Malloy:

They don't compare. The Atari is so superior to the C64 that I don't
know where to start. The graphics are better, the games are better and
from what I have seen, there is movve software for the Atari than the
C64. One last comment: A very close friend of mine, who is in the
business of writing games, believes that the Atari is better than; C64,
VIC-20, Adam and TI. He was given all of the small computers and all of the
game machines on the market to write software for them. So he knows what
he's talking about.

Get copies of "Analog" and "Antic". I remember seeing an ad for
Draper Pascal in one of them. I don't remember the price, but believe
it to be less than $100.00. The (p-code ?) compiler got pretty good
reviews awhile back in one of the magazines.

You might want to look at "Action" by OSS. There have been some nice things
said about it. (Its not Pascal).

How many people besides me got burned by "HI-RES"?
     HI-RES -> ATARI -> ATARI/Commodore -> NIL.

I have an ATARI 800 and, being stingy, I do not have an 850
interface. Some comment in this newsgroup recently led me to
believe that the 800XL didn't require an 850 interface. Is this
true? If so, the cost of an 800XL may be better than an 850
interface these days.

Please send responses to:

Last Tuesday's N.Y. Times had an ad (Science Times Section C)
for the 800XL at $99!!! Much cheaper than the peripherals!
There were also several other ads for similar prices, all
below $120....most around $110. Tramiel was quoted in the
Times business section saying other computer makers were "greedy"
and he apparently means business. Oh boy! Wish I hadn't bought
my 800 3 years ago. I won't admit what I paid!

Attention all Atari 810 disk drive users.

I am in need of your invaluable experience with the 810 drive.

I have access to an Atari 810 disk drive for about $125 with
full warranty coverage. I had my eye on an Indus for some
time now and would probably have bought one, but now this
seeming deal appears in front of me. Is there anything
other than the speed of the drive and the fact that it's
bulky that is negative. It's a great deal but I wouldn't
want to throw my $$ away. Any information or opinions
by those of you who have a 810 (or had one) would be greatly
appreciated.

For those of us who did not purchase a 850 interface,
and now desire to expand to a printer and a modem
with our 800, what choices are there?

I believe that you can print thru the joysticks with
certain interfaces, but I've not heard good things
about them.

Any information would be gratly appreciated

   I have not received any responses locally so I am reposting to
a larger audience.

   I have an atari joystick that I would like to connect to the game
port of a Quadram board in an IBM/PC. What I need to know is what
are the pin assignments for both the atari and IBM/PC to I can make
a connector.

     Thanx in advance.

Hello All,

I have been given an Atari 400. Now, the question is - What can be done with said beast? Is there any scope for expansion? Are there any higher level languages available for this?

My knowledge of Home Computers is nil. My personal computer is a VAX (Semi :-). I would like to utilise it in some suitable fashion. If there was some way of inputing data, I might consider buying an Atari 800 XL, and somehow trying to couple the two via a loosely coupled network of sorts. This might be an interesting way to make up for the lack of cycles. I can imagine all sorts of interesting hacking possible. However, there would have to be either a) A decent Assembly Language environment OR b) Some language with control structures.

Regards,

Ever wonder just how close the Atari and Commodore 64 are in architecture? Well, this month in Compute! (Dec. 84), there is an article and program that will allow C64 users to type an run BASIC programs written for the Atari series with the least amount of changes possible. No provisions for

Player/Missile and Sprite graphics, although these are highly POKISH
and not part of BASIC anyway - but can be converted easily.

 Since both machines have the same resolution in the graphics modes, the
transition theoretically should be quite easy, and it is - the program
sits in 2K of RAM that is out of the way, and you can even use the DOS
wedge while the emulator is intact.

 ALL OF THE Atari graphics commands are supported (except the XIO fill
command which is replaced by a more sensible FILL command):
PLOT, DRAWTO, SETCOLOR, COLOR, GRAPHICS, etc.
- some interesting notes:
  * each of the commands are allowed to be entered with and abbr. just as
    on the Atari, these abbr.'s are not expanded when listed.
  * the features of a text window on the bottom of the graphics screen,
    re-enter a graphics screen without erasing, and combinations of the
    two are supported by adding +16 or +32 or +48 to the GRAPHICS command
    just as on the Atari
  * the user of the emulator loses NO BASIC programming space since fill
    stacks and graphics screens are "hidden" under OS ROMs and BASIC ROMs
  * since the new commands are re-routed through CHARGET, they are all prefixed
    with an exclamation mark "!", but this easy to get used to.

PICK UP AN issue to take advantage of this. There are also some other
good articles for C64 graphics, and tools.
Read about the MSX Japanese invation of standardizing the home computer
market - are we doomed?

The Atari joystick and the IBM PC game port are fundamentally incompatible!

The Atari joystick is a collection of on/off switches.

The IBM PC game port (according to the Tech Ref; I assume your Quadram
is the same) calls for proportional control using 100K pots. (I've
heard a nasty rumor that it really needs 400K, in spite of the manual.)

Thus no amount of cable transposition will help. Sorry.

I have no complaint with puzzles, my kids have a bunch of them. But I don't
think they're any better social tools than the computer. My six year old
daughter plays with our computer with her 3 year old brother and with her
best friend and when she goes to her friend's house she plays with their
Mac (which, sadly, she much prefers to our PC). They squeeze into the
same chair and give each other advice and help each other do things. It's
one of a relatively few things she will do directly with her brother, at
the moment.

January 1985 ANTIC TOC
Theme: Super Utilities

Page Article

12 COMMUNICATIONS: Starting a Bulletin Board Part II
A review of available BBS software.

17 THE TOOLBOX: BASIC Searcher
BASIC Searcher finds the lines containing any command, operator, function or variable in your BASIC program.

19 TYPO II
An easier proofreader for Antic type-ins

20 PROFILES: Interviewing Dan Bunten
The designer of "Seven Cities of Gold" and "M.U.L.E.".

30 Q.T. (Game of the Month)
Q.T. is an inventive game boasting three different screens, each with six increasingly nerve-wracking levels of difficulty. [24K cassette, 32K disk]

33 SCRAMBLE [Bonus Game]
A computerized, competitive version of the familiar word finding puzzle.

34 WIDE TEXT
The easiest and most powerful method ever developed for inserting bold double-width Graphics 1 letters anywhere on the screen in Graphics 0, the standard text mode.

36 TOUCH TABLE CURSOR
Control the cursor in your own BASIC programs with a KoalaPad or Atari Touch Tablet. Perfect for selecting menu options or educational quiz answers.

40 DISKIO: Supercharger for Atari DOS
DISKIO is a superb enhancement for DOS 2.0S. For openers, it provides access to nearly all the DOS functions directly from BASIC or Atari Assembler Editor. It also has an alphabetical disk directory display and needs only a few keystrokes for disk file operations.

44 THE PARALLEL BUS REVEALED
The first part of four parts. Until now, the Parallel Bus Interface has been one of the big mysteries of ATARI XL computers. This important ANTIC series--by one of ATARI's former top technical executives (Earl Rice)--will at last provide all the information necessary for tapping the power of this 100K byte/second connection.

48 ESCAPE FROM DOS3
Say goodbye to glitchy DOS3 forever! Convert your files back to good old DOS 2.0S. You'll need three blank disks

and your DOS 3 Master Disk. You also need an article from July 1984 ANTIC.

51 SOFTWARE LIBRARY
All the programs from the magazine are here in the middle.

65 NEW BOOKS FOR ATARI
Roundup of the latest releases.

69 OPCODE FINDER
Opcode Finder is a chart that conveniently brings together the symbols for all three formats of representing machine language subroutines in BASIC programs. This information makes it a lot simpler to hand-disassemble short sub-routines for study or modification.

76 NEW ATARI FLIGHTS
A software review and comparison of FLIGHT SIMULATOR II, SPACE SHUTTLE and F-15 STRIKE EAGLE.

79 PRODUCT REVIEWS

Realm of Impossibility (Electronic Arts)
Rails West (SSI)
X-BASIC & SCROLL-IT (SUPERware)
Montana Reading Program (PDI)
Chaos (Touch Stone Software)
BOOKS
Adventures with the Atari (Reston Publishing)

Comments: Someone asked about Keystroke Artist. I noticed in one of ANTIC's own ad that they have back issues of the magazine now available on disk. Keystroke Artist was in the 8/83 issue and it is available for $12.95 plus $2 shipping. If you buy three disks (any issues), you get a fourth free (total $38.85 + $2 shipping). The new Customer Service Number for Atari is (408)-745-4851. No longer toll free. The subscription rate for ANTIC is going up January 1985. They are still honoring the $24 per year rate through 12/31/85. ANTIC is compiling a list of all ATARI User Groups. If you are an officer and would like to get a free listing in ANTIC magazine, write or phone them. If you don't have the address or phone number, email me and I'll give it to you. Happy computing...

  My father-in-law has an 800 with the micro-bits printer interface using
  the joystick port. I have a stock 800. The Monkey Wrench utility cartridge
  for the right slot on the 800 will not respond to the scroll command, when
  used with his 800. It works fine with mine.

*** I am not a bug! I am a feature! ***

The December 10 issue of Electronic Engineering Times has an article on Atari's new computers which I've briefly summerised below.

THE NEW ATARI 16-BIT COMPUTER

* 16-bit 8088 microprocessor
* 128-256 kbytes of RAM
* Single 3-1/2-inch drive for MS-DOS software
* Custom VLSI circuitry
* PC-DOS-like operating system
* Software is expected to be compatible with 3-1/2-inch MS-DOS packages for new IBM PCs, and PC-compatible portables with 3-1/2-inch drives.

THE PLANNED 32-BIT ATARI COMPUTER

* 32-bit 68000 family (68008?) microprocessor
* 256 kbytes RAM standard (using low-cost 64k chips)
* Custom gate-array graphics and audio circuitry
* ROM operating system (like Macintosh)
* Ability to do hi-res color graphics on home TVs
* Accept ROM-cartridge software, 3-1/2-inch microfloppy media

Options for each: Networking hardware, modems, hard disks, coprocessor emulation modules (IBM, Atari).

Regarding the Atari/Amiga/Commodore situation: When Tramel took over Atari he apparently assumed that many of the custom graphic and audio chips developed by Amiga in conjunction with Atari would be available to the new Atari Corp. Just a few days before Tramel acquired Atari, however, Amiga returned Atari's payments and declared that the chips did not perform as contracted.

Commodore has now acquired Amiga and is expected to show the new 68000-based computer at next month's Consumer Electronic Show in Las Vegas. Tramel has filed suit against Amiga, arguing that Atari is entitled to the technology.

This suit has not been settled.
   One of the high points of the new computers is that they will use custom gate-array chips to produce high-quality color graphic displays on home television set screens, making an expensive hi-res monitor unecessary. This should allow the new machines to be in the $400 to $1000 range.
   If Tramel succeeds in showing the new 16-bit machine at the CES show in January it's believed that it could be available by late spring.

I am trying to get a game program from the latest issue of COMPUTE!
running, but it seems to bomb on the part when the program tries to
modify the internal character set. The relevant code is:

```
     2000 POKE 559,0:DIM S4(1024)
     2010 A=ADR(S$):B=INT(A/512+1)*2:CBASE=B*256-A+1
     2020 FOR I=0 TO 511
     2040 S$(CBASE+I,CBASE+I)=CHR$(PEEK(I+57344)):NEXT I:H=16:V=23
```

The poke 559,0 blanks the screen and it never comes back. If I leave the
poke out then I get an error message at line 2040 that there is no
FOR associated with the next. Can anyone see anything wrong with
the code here? It checks out using computes checksum program, but
it doesn't run. Aftyer typing in 11 blocks of code I sort of want the
thing to run now.

This is on an 800XL. Any help would be greatly appreciated.

For Sale:

Atari 800 Computer system with all of the following equipment included in the price:

- Atari 800 Computer with full memory expansion (runs 400/800/800XL series software)
- Two Atari 810 disk drives (fully compatible with Atari 1050 drives)
- Atari 850 Interface Module (provides four RS-232 ports and a parallel port)
- Atari BASIC Cartridge
- Atari Editor/Assembler Cartridge
- 2 Game Cartridges
- 1 Joystick
- Documentation for all of the above
- De Re Atari Manual (the definitive Atari text)
- All power supplies, cabling, etc.
- Miscellaneous pirated software

The system was bought in February and has been sitting
on my shelf ever since. The best offer gets it. Makes a
great Channukah/Christmas gift.

I SWEAR! As much as I like the present Ataris, if they come out with
8088 junk as a new product, I'm moving to the Commodore Amiga! I'll
take the 68000, the 32000, the z8000, even the z80 over the 8088!

barf! gag!

Does anyone know if software written on 800 will run on 800XL?
Are disks from 810 compatable with the new drive (1050 ?).
Can I take stuff from 800 and continue on XL?

Thanx,

Just to add a bit more confusion to the discussion of Atari's new machines. I have heard a rumour, from a former Atari employee, that the new machine will be using National's 32032. It is not as well known as Intel's or Motorola's chips, but it has some very nice features. I guess we'll just have to wait and see what the new machine will look like.

===

MOST programs written for the Atari 400/800 will run fine on the 800XL. About 10-20% of the third party software, however, will not run without first loading a "translator" program which effectively converts the "new improved" XL operating system back to the old standard 800 OS. An "XL TRANSLATOR" disk is available for a nominal charge from ATARI. There are also some commercial products, such as the "XL FIX" from Computer Software Services, which are a little nicer (don't have to be reloaded to boot another disk, etc.). Depending on who's telling the story, this irritating little "feature" (quirk?, bug?) comes about because 1) ATARI changed some locations in the new OS which were supposed to have been "sacred", or 2) some third party software companies took short-cuts and used locations which were not "guaranteed". This problem only occurs on some older programs; I do not know of any programs released in the past year or so which do not run on the XL.

But the good news is, the new 1050 disk drive is totally compatible with the 810 drive.

There was another question about monitors for the 800. That's easy. The best monitor for the 800 is the COMMODORE (1701 or 1702). Period. The reason it's so good is that it has separate chroma and luminance inputs in addition to the standard composite video. This gives an extremely sharp and crisp picture, and even looks fine in 80 col. mode. If you use the composite input, the picture quality is only mediocre, so I would recommend the COMMODORE monitor ONLY for a standard 800 -- the 800XL does not have a chroma output.

[........]

What I've heard about Deep Blue C is that it compiles to an interpretive
code (a P code if you will), and thus it is slow. Unfortunately, I've
also heard it is a more standard version than the other alternative(s).

Personally, I use Forth, as its fast and interactive. I rarely have
to recompile the whole thing when I make mods (no time for a nap),
as Forth is an incremental compiler (you can interactively compile
small bits at a time).

Good luck! Software companies tend to disbelieve stories about
"missing documentation" -- the ol' rip-off copy trick. I presume
you've double-checked the packaging for an address?

[]

I have an Indus GT disk drive for sale. It is about 8 months old and in perfect condition. I did use it, but not much. I am selling the entire system, actually, and I've already sold the computer (one of the later 48k 800's). I am including with the drive 20 disks worth of software. Some of the titles:

DOS XL (OS/A+) and an improved Atari DOS(2.6f)
Indus Word Processor
Indus Data Base Manager {they come w/the drive}
Atariwriter
Microsoft BASIC
BASIC A+
MAC/65 Assembler
InterLisP/65
Diskey/Disk Wizard
Koala Graphics System {cracked for joystick use}
Planetfall & The Witness {Infocom}
Lots more graphic games & misc. other stuff

Take note that all of the software except the Indus stuff is undocumented (you know how it is :-). I am asking $300 and will pay to ship it if necessary, etc. Please respond by net mail only.

[Go on bug, make my day..]

  I'm sorry if I appeared overly critical of ACTION!, 'cos I really do
like the language- I think that saying it should never be used is going
a bit too far. It is the *only* high level language I use on the atari, and

it is better that B***C for quick hacks- who notices ~1 second compile times? And the editor really speeds changes up. I guess the reason why I whined was the excellence of the whole package threw these teeny-weeny problemettes into stark contrast (suck, suck :-).

Support doesn't bother us out here in the UK- we never get any. We send off our registration forms like good little boys, and they're recycled as fire-lighters somewhere in the US snail.

What do you mean; who needs recursion ? I always calculate my factorials that way :-). Seriously though, if you want to write a recursive descent parser (I must admit I've only just started mine) there may be some problems. I never could figure out LALR parsers, so LL(1) is the only way.

Another couple of questions;

1. Can you open the second screen in the ACTION! editor onto the same file without reading in a fresh copy?
2. Does anyone out there used the atari Macro-Assembler (MAC/65 hasn't reached the black country yet)? If so, how do you run a .OBJ file? The only way I have discovered is to load it using L,postfixed /N, then running at address. However, it just hangs up at the end if I 'brk' or 'rts' from the program.

I haven't had any mail reach me, but then again, all the news that has reached here has been jumbled chronologically (I still can't work out that DOS requirements letter) so here is (I think) my address relative to 'seismo'

seismo!mcvax!ukc!qtlon!flame!ubu!snow!tjb

Thanks for your time and help,

The latest creative computing magazine had a description of
Atari's new AMY music chip as well as descriptions of their new
machines. Here is an excerpt about the AMY music chip.

> "Features 8 fully independent multi-timbre voices
> comprised of 64 seperate and software-configurable
> oscillators which can easily change sonic
> characteristics on the fly. AMY handles 10.75 octaves
> from 4.8Hz to 7.8KHz which encompasses the range of an
> 88-key piano.
>
> In contrast to more conventional sound synthesis
> devices like Commodore's SID chip, AMY is based on
> digital sampling. This approach "recreates" the waveform
> rather than attempting to imitate it. AMY has a 30KHz
> digital sampling rate and a 60dB dynamic range, and runs
> of the internal clock of the XEM at 7MHz.
>
> Those who have heard AMY confirm that it can
> realistically portray a wide range of musical sounds.
> Listeners report, for example that AMY simulates the
> highly distinctive "bow attack" of the cello sound with
> almost discomfiting accuracy."

I originally bought the c64 based on it's sound capabilities and
the promise of a multi SID keyboard(they never produced the
keyboard though). This AMY chip though looks like it is 10 times
better than the SID. Some of the features are comparable to
board level products like the Mountain music system or the
Casheab music synthesizer that cost from $300 up to several thousand
dollars. If atari would come out with a keyboard based on a few of
these chips and a midi interface so that it could be controlled
by the new ST computers it would be a big hit.

BTW in the outpost atari section is a remark by sam tramiel that
the new 32 bit machine will use the 32032.

Yes, I've double checked. As for ripping off, the software is in a
cartridge, not on a disk, so how am I going to copy it? The plastic boxes
of software were not wrapped in clear plastic, so it would have been
an easy matter for a browser to open the box and take the documentation.
I wish I had opened the box before buying it.

I still have no responses giving Thorn EMI's address.

Don't feel disappointed. If you had waited to get an Atari system with
an AMY chip, one of two things would probably happen:
  a) it may never materialize at all (like that multi SID keyboard),
      and you would have waited for nothing; or
  b) by the time it materializes, some other company will already be
      touting the new super-duper sound chip that they're working on
      that's 10 times better than AMY, so you'd end up waiting for that.

"State-of-the-art" is a fleeting condition. If you feel that you must
always have state-of-the-art equipment, you must be prepared to scrap
all of it each year as the state-of-the-art marches on.

[...?]

             Maybe you did misunderstand! Either that or I am missing something
here. My implication was that most of the software I have is pirated. I was
not aware that to mention software pirating in public was a no-no. I still don't
think it is. Is that what you inferred?

Sorry to be picky, but a major record company in the EMI group is

Capitol, as in Capitol EMI Canada Ltd., whereas I believe RCA is still
independent (although I seem to remember hearing somewhere that the
Rockefellers owned it... I can't see the FCC permitting a foriegn
interest such as EMI to own a company that just happens to own a major
broadcasting interest (read: NBC)). If anyone out there wants a hint,
check the address of the manufacturer on the back of any Capitol
album, then write to them asking for the address; they should have it
around somewhere.

David,

I looked at all my game instructions from Thorn and could only find
that they are in England (somewhere). I guess they don't (or didn't)
care to hear any user comments - good or bad!

I did find a review of one of their games that gave the following as
Thorn's address:

     Thorn-EMI Video
     1370 Avenue of the Americas
     New York, New York 10019

To tell you the truth I found the game to be a real BORE! it takes soooooo
long to get into the air that I lost interest in even trying to get
the flying part of it down (er up?). I think Flight Simulator II is much
better.

Good Luck!

The Book of Atari Software 1984 gives Thorn EMI's address and phone as

Thorne EMI Video, Inc.
1370 Avenue of the Americas
New York, N.Y. 10019
(212) 977-8990

I have on several occasions bought cartridge software that was missing directions, especially if it was bought on a bargain rack somewhere where little probing hands can open the boxes (E.G., Kaybee toy and Hobby stores here are dumping all Thorn cartridges, out on a table and NOT wrapped in plastic).

I have, however, bought Jumbo Jet Pilot (what a dog!), directions and all. Xerox and mailing address in hand, I have also been known to be generous on occasion.

SO, now can we get off the topic of Thorn, piracy, open boxes, ethics mom and apple pie???

I have read as much as I could find regarding Atari's new 68000 series of computers. (the ST520 and ST130). And have

not been able to get any real spec's or cost figures yet.
My first impression is that these systems sound great,
but of course all I know about it is how much memory it has
and a very broad range of costs... It appears that it (ST520)
does all Mac does, and better, and much cheaper...

So, what is the opinion of the net on these machines?? So
far, I haven't seen much posted on the merits of buying one.

And, more importantly, what are the specs? Have they been
released, or have I just not noticed them?

Thank you Brian, for pointing out where the misunderstanding was. I

had not thought to mention that I am not in fact *selling* the software, but giving it away. The payment would be for the drive and the disks that the software is on. I can understand that you (anybody) would be disturbed by the idea of selling what one has gotten for free. I certainly would be too. That would be a pretty low level for anyone to sink to, and I'm glad that I'm able to clear the air here. I apologize to those who were (or still are) offended.
- thanks

Hi:

I was just about to get Macintosh, when ... well, you know
the story...

Are there any materials available about those new GEM machines
that would help me to get out of this dilemma: what to buy if
I have a good offer on Mac but not as good as what atari claims
to offer ?

Would you suggest any reviews, "not a review" disclaimed articles,
and your personal observations on this subject ?

The obvious initial lack of software for the new machines is not
a problem, to a degree, of course, since it could also be a
opportunity.

Please, H-E-L-P !!!

One of the concerns was atari's financial complications, so
the financial and support reliability observations will be
greatly appreciated.

If the net expresses interest in this subject I will post a
summary of the responses. I also will not include in this
summary any mail on this subject that will state "not for
distribution", etc.

Thanx in advance.

I'm not sure why Scott Hessler's cartridge would tend to
'disappear', but I've had my ACTION! cartridge for about 9 months
now, and it certainly has been inserted more than 100 times, but
the plating on the contacts is still very much there. I think
there may be a problem with that particular piece (sure that spilled
tea didn't get just a little too close to the cart?? Tannic acid
does wonders for tinplate..), and OSS should replace it
without complaining.

Re. the lack of features, I agree with Scott that what is present
is pretty good, considering BASIC is really the only alternative..
I guess I can always think of features I would like it to have, but
there is so much I can do with what there is now .. again, the
bitwise operations and structures are such an improvement over Basic.
With ATARI apprently planning to keep the 800 series alive with the
new XE's, I hope OSS will keep ACTION! alive and bring out bug-freer

versions (you listening, Clint?)

In the March '85 Byte there is mention of a programming language that
is C-like and runs on the Atari called 'Action!'. Unfortunately, it
never mentioned who markets it. Does anyone in net-land know where I
could find it?

Summary:

Commodore recently brought out 2 more machines, the C-16 and the 128k
version of the 64. This is probably an omen of Commodore's impending
doom. When Atari brings out their ST, they can sell it at $400
and not worry about any of it's other products (which they are
trying to "phase" out) decline in profit/productions. Commodore however,
when they release this "wonderous Amiga" machine will HAVE to
raise the price so it does not damage the profits coming from the
C-64 and their newly released machines.
  On the other hand, this might be an advantage. If Amiga turns out to
be a nice UNIX machine which is loaded with software for business people
 even at an "inflated" price. MIGHT. That sector of the market is flooded with
"IBM" stickers, and people will STILL buy IBM machines over anything..
 ("It says IBM on it, it's gotta be good" syndrome)
  I remember reading a COMPUTE! article about the new ATARI machines
and it seems that they are trying to sell them as "business/home"
computers - like Apples. I think that they could do this
successfully if they convince the general public that "ATARI IS NOT
PLAYING GAMES ANYMORE".

  What it comes down to is if the ST is really good and cheap, Commodore
will have a fight on it's hand. I don't think the ST will hamper the Mac's
sales much. This however depends on whether Atari can successfully sell
the machine to the business community. I doubt it. But maybe.. If they
do, then Apple and even IBM might be in for a bit of a shock.

Buying a computer is always a waiting game, but this might be one
to wait for..

Of course, if the ST can't run UNIX then what use is it! (except
for playing games..)

I called Atari with regard to their policy towards software developers.
In particular, I was trying to see if they were interested in my
company's software.

Their policy is not very good:
     1) The machines will be sold in K-Marts and similar stores
     2) No software will cost more than $50
     3) On that $50 software, developers will get no more than ONE dollar.
     4) If you want a machine now, you can get one for $4,500, and all
        that gets you is a machine with floppies and a monitor, plus
        a download kit. No C compilers etc.
     5) No advances to developers of any kind
     6) No bundled software except GEM.

At this rate, most developers are saying no. You'll have to wait a while
for good software on this one, folks. $1 per product is a joke. Your
product would have to become one of the all-time sales greats of the
microcomputer industry to make you some decent money.   At the same time,
they are distributing the computer through distribution channels that a
small company can't use easily or even get access to. And who ever heard
of developers having to pay a 500% premium to get a machine whose success
is uncertain.

My system could not find the sender, so I'm posting a followup.

OSS (Optimized Software Systems) in California makes it. Also get their DOS-XL
for the ATARI. These are the same guys that wrote ATARI BASIC.

I am interested in interfacing a synthesizer (probably a DX7) to a
computer (IIe, PC etc.). I am beginning to understand what I need to
do hardware-wise, I am still confused as to what software is available
currently, and of what it is capable.

How many tracks can I control? How many voices can be controlled
simultaneously on an instrument such as the DX7, and to what degree of
independence? How versatile are these programs musically? Is there
a void here software-wise?

                              I appreciate any response,

                                    Don

I recently acquired a cartridge-based game for my Atari 400
entitled "Journey to the Planets" by Roklon Software. My
question is a rather embarrasing one, but it's beginning
to drive me crazy. . .

DOES ANYBODY KNOW HOW TO GET THE RUBY CHAIN BACK TO THE SHIP ???

I've figured out how to get my hands on the chain, but each time
I pass through one of the monoliths, it vanishes !!! I have solved
all of the other puzzles (planets), and so would be more than happy
to trade for this information. Failing a solution, I would also be
interested in comparing notes with others in the same situation.
I have made some useful observations about this planet, and would
like to exchange ideas with others who are currently trying to
solve it.

Best Regards,

[eat white-hot, flaming text!]

For those of us who haven't been around long enough to follow the discussion regarding the new Atari computers, the following is blatantly excerpted (without permission) from this month's 'What's New' in BYTE:

'Two New Color Computers from Atari'

Atari has two new color computer lines: the 68000-based ST and the 800-compatible XE.

The ST comes with a two-button mouse and Digital Research's GEM, a user interface that has pull-down menus, icons, and overlapping windows. GEM is embedded in 192K bytes of ROM along with TOS (Tramiel operating system, named for Atari president Jack Tramiel) and a game. For more on GEM, see page 39 of the December 1984 BYTE.

The ST, which can handle television, composite color, monochrome, and RGB outputs, produces graphic resolutions ranging from 640 by 400 pixels (monochrome) to 320 by 200 pixels (16-color mode). Its 84-key keyboard is augmented with a numeric keypad and 10 function keys. Rom cartridge, RS-232C serial, Centronics parallel, and floppy- and hard-disk drive interfaces are supplied. Also, the ST carries a three-voice sound chip and a MIDI port for linking it to musical instruments and synthesizers.

The 128K-byte Model 130ST will sell for approximately $400, and the 512K-byte model 520ST will be about $600. Shipments are to begin shortly. Atari plans to offer a 10-megabyte ST hard-disk drive for about $600. Both a composite color monitor and a 3 1/2 inch disk drive will be priced in the $150 range.

Four versions of the Atari XE computer will soon go on sale. The basic XE comprises a 57-key keyboard, five special-function keys, a ROM cartridge slot, BASIC in ROM, and four-voice sound. Graphic resolution is 320 by 192 pixels. Atari's 11 graphics modes and Player Missile Graphics are provided.

The Model 65XE, with 64K bytes of RAM, will cost $120. The $400 portable 65XEP comes with a built-in floppy disk drive and a 5-inch monochrome monitor. The 128K-byte 130XE will be under $200. The 65XEM will be outfitted with an eight-voice music synthesizer chip. Its pricing had not been finalized at press time.

Contact Atari Corp....

//

Only two comments:

1. If this machine is everything the above says it is, the Mac better watch out. Even the consortum prices can't beat that....

2. A 512K, 68000-based computer w/mouse, 10-meg hard disk for *less than* $1,500? Comments, IBM?

Anyone seen one of the new machines? (Especially 16 bit)

I call all the places I can find in trade magazines and always am told
"Well, they should arrive next week sometime", or
"Must be Atari's fault", or
"What's an Atari?". :-)

I know you can buy one for software devopment ($3000 or something like that)
but if as Tramiel says they've been producing the 65XE for a month or so
now there should be some Somewhere!

Atari said they would wait until they cleared out the old
inventory of 800XL's. This may be a while because when I visited
toys r us in early january and just recently there were still a
lot of stickers for the 800XL's. It looks like sales have sort
of dropped off somewhat. It is not only atari that is down but
the c64 as well. The 16 bit computers are not supposed to ship
until April at least. One thing I noticed is that the amount of
software displayed for the c64 was about 5 times greater than
that for the atari. The disturbing thing about this was that a
lot of the titles for the c64 were originally written for the
atari. Even though I am a c64 owner, I sort of wonder whether

toys r us is pushing commodore stuff intentionally.

They had a full page article on atari and their chances for
making a comeback in the February 10 business section of the
N.Y. Times. Near the end of the article they said that one of
the advantages of the amiga over the ST line would be
multitasking capability. I somehow doubt though that they have
put in a mmu chip to do this. More likely is that the bundled
turbo pascal generates relocatable code and thus is limited to
32kbyte segments. I am not sure that this would be an
advancement as it brings back one of the worst features of the
IBM pc namely segmentation, except that it is even worse since
at least you can have 64k segments in the pc. If you want a true
multitasking environment I can bet that you probably won't find
it in these machines. Of course neither can the IBM pc(excluding
AT) or the macintosh.

(Hey,I like the new name of the Commodore 68k machine, eh amigo!)

This may already have been covered, but I need to get some information
about using the 800 as a terminal to a UNIX* system. Three questions:

1) What's the best modem to use? How do you set it up?

2) Do you need emulation software? What's the best? Is there anything
good in the Public Domain?

3) Does anyone have a working termcap/terminfo ?

Experience with setting this all up would also be appreciated. You
could consider me a novice at all this since I've been SA strictly around
big U*X systems.

Please *mail* me any help you have and I'll summarize to the net.
If you need to know we're running System V in various releases (why not?,
we paid for it!).

Thanks in advance for any help.

<from the inside front cover>
     Distributed By
  The ATARI Program Exchange
      P.O. Box 3705
      Santa Clara, CA 95050

To request an APX Product Catalog, write to the address above,
 or call toll-free:

800/538-1862 (outside California)
800/672-1859 (within California)

Or call our Sales number, 408/727-5603

(c) 1982 Atari, Inc.

- - - - -

I ran out and bought mine a year and a fraction ago, when they were obviously unloading the 800 line. The local technical bookstore was unable to get delivery on it then, so I went directly to Arari's APX - I had a catalog then - and got it by mail. Seems to me, it was $19.95 or the like, but I wouldn't bet on it.

If you can still contact them, it is certainly worth getting - it is all I have ever heard said about it plus quite a bit more.

If they claim it can't be bought any more, see if they will agree - in writing - for you to make a copy of an existing one, for free or for a nominal fee. If they will, I'll be glad to work something out with you. It is an absolute 'must have' reference.

An aside: the other 'must have' is their "ATARI Home Computer System Technical Reference Notes, includes: Operating System User's Manual, Operating System Source Listing, and Hardware Manual". Same source, 500 or so pages of EVERYTHING KNOWN by the developers about the HW/SW!!! I remember it at maybe $29.95, but wouldn't bet on that memory either.

A friend of mine has an Atari 800XL and wishes to get a printer for it. There are many good printers out there that have Centronics interfaces as standard. What he needs is a good and hopefully inexpensive interface from his 800XL to a printer.

Does anyone have any suggestions for an interface such as where he can get one, price, and reliability. Also, where would this interface plug into on his Atari?

Thanks in advance.

<Sacrificial line>

I recently upgraded from an Atari 400 w/32K to an 800XL with the full wad of
64K.

What I thought was strange was that when I tried my LOGO cartridge, it showed
no more nodes (memory available) than I had with my 400.

I tried the following algorithm in both LOGO and the builtin basic:

```
    address = 0
    loop while (address < 64K)
     temp = peek(address)
     poke address,127   !Put distinguishable number in mem loc
     if peek(address) = 127 then print "ram",address
                   else print "rom",address
     poke address,temp
     address = address+1024
     end loop
```

As expected, Basic showed 40K of RAM available (40-48K=basic code,
48-64=OS ROM, hardware registers, etc etc). The odd thing is that LOGO

showed there to be only 32K.

My old hardware manual says that RAM is usable between 32K and 40K if there is no right cartridge in the non-XL 800. Is an 800XL different? Is a LOGO cartridge different (has 16K?)

BTW, is there any software which uses the memory above 40K by bank-switching or whatever?

Atari warns that the diskette should always be removed when powering the 1050 up and down. How important is this? Will it hurt the DRIVE if I am willing to loose a diskette once in a while? (The fewer steps the kids have to perform the better.) How about leaving the 1050 powered on all the time? Any problem?

And finally (this is disk-related, so I'll put it in the same note): The DOS-3 manual says that a specially formatted blank disk comes with the drive to copy the master diskette onto. The formatting is alleged to allow the drive to be faster than the formatting that the drive writes. Open the drive box. No blank diskette. Call store. None of them have a blank. What gives? Did they upgrade the drive formatting firmware, but not the DOS manual?

Thanks for the info!

Burns

Summary:

The XL's do have 64K, but the 'extra' 16 K is hidden beneath the
cartridge, and as you rightly guessed, is not usually available, in
fact hardly ever available. OSS (optimised software systems) does make
bank switched cartridges for the Atari; called 'Supercartridges', their
BASIC XL, ACTION!, and MAC65 are in those cartridges, which basically
are 16K carts. which appear to the machine to be 8k carts, and which
bank switch to give you an extra 4K. They also sell DOS XL, a true
double density DOS which can use some of the memory that exists in parallel
with the OS to give you some more (beyond the supercart); DOS XL can be
used with any XL machine to get this extra memory, not just with supercarts,
though they work together to give even more.

Does any one out there know anything about a book entitled
"DE RE ATARI" ??? How can I get one? Who published it?
Etc.? I understand it is a very good reference for basic
technical information on Atari.

                        Thanks in adavance,
                        Sincerely, Gary McNees
/* ---------- */
        In one of the atari magazines (either ANTIC or ANALOG somebody asked
the same question. Their answer was that the book is impossible to find, but
there is a book out (I forget the name!) that is supposed to cover what is
in DE RE ATARI, but in a much more readable format. You should look through
the last two or three issues of those magazines (I'm almost positive, that
it should be in the ANTIC!). If you find the answer, please post it, and
I will do the same !

There is NO protection; you could conceivably wreck a cart. I guess atari
thought it was dispensable, it certainly wasn't essential, and besides it
made it somewhat easier to copy cartridges onto diskfiles.. I'd say you'd
better tell the kids that their favourite games may get wrecked..

The advice is meant to protect diskettes from being accidentally written to
during transients that occur during power on/off. However, the 1050
also does not have a head loading scheme (basically, the Tandon 55B drives
used in it do not have head loading), which means that the head is always

in contact with the disk when the disk is in & the doorknob is down; I personally wouldn't want to run the risk of some transient destroying the *head*; though the drive is designed to prevent such weird things from occurring, they do occur (the head is delicate, so is its suspension, and the whole thing may get jerked off). I'm no one to offer advice here, but I suggest you tell the kids the right way to do things, the little guys are often more careful than adults I've known ..

Re. the formatted diskette from atari, I don't think that has been shipped since the early days of the 810's .. it doesn't really make all that much of a difference' just let it go..

Although the Atari 800 has a right cartridge slot, it is also possible to make 16K cartridges that work as if one had cartridges plugged into both the left-hand and right-hand slots on an Atari 800. The advantage of the 16K cartridge is that it can work on Atari 400s, 1200XLs, 600XLs, and 800XLs in addition to working on Atari 800s. Of course, it takes 16K of addressing space, leaving the Atari with only 32K of easily-addressable RAM.

The BASIC/XL cartridge from OSS uses some sort of bank-switching scheme that allows it to have 24K of ROM while taking up only 8K of addressing space (the same as the Atari BASIC cartridge or the built-in BASIC on XL machines). It leaves 40K free. I don't have one, so I'm quoting these details from memory.

I have heard many, many comments about different interfaces for the
Atari line of computers, but none are as reliable or as supported as
the Atari 850 Interface. They can be found through most mail order
places for about $70. With one you can add both printers and modems.
I have 4 computers (three at home and one at my office), and I have
the 850 in both places.

Anyone have a better idea?

Why wouldn't they put an mmu in? You don't need a fancy and expensive
mmu chip to do memory management. You can build a quite decent mmu out
of a small number of standard, cheap chips.

Recently I saw an add in Antic or Analog for a software bad-block/custom
format program. Does anyone know how a software bad-block generator
would work on an un-altered 810/1050 drive? The obvious way would
be to perform alternating writes with different bit patterns until
a write error occurs, but this seems a little brute-force.
I don't have any documentation on the way the drive handles SIO commands,
but it might be possible to specify very short time-out times to the

device, or to interrupt it during the execution of a command, or maybe
there are undocumented CIO commands for the device? Does anyone
out there have any ideas.

The book 'Your ATARI Computer' by Lon Poole is just about
a bible for Atari owners. It has all the stuff you need, most of
what De Re Atari has. I'd say it is a must have for atari owners.

These are some points I came across while reading the July issue of
ANTIC magazine. Might be of interest to some

DISK DRIVE:
     TRAK is advertizing a new drive called the "CHAMP" that lists
     for under $400. It looks similar to their other drives but
     doesn't have all the fancy readouts on the front. It is double
     density and comes with: a) double density DOS; b) POGOMAN by
     Computer Magic (game); c) TRAKMANAGER - Diskette filing system;
     d) a games and utilities diskette. A TURBO option is also
     available.
AMODEM Program:
     This was a special issue on communications and contained an article
     and Version 4.2 AMODEM terminal software. But the letters column
     also mentioned that Jim Steinbrecher who wrote the article also
     has a customized version that allows owners of Atari 835 and 1030
     modems to upload and download programs. It is available on his
     ARCADE BBS in Michigan (313)-978-8087 or on disk by mail for $10.
     If you want an address, mail me.
Programs:
     There is another company, AMTYPE Corp., advertizing that they will
     type and mail computer magazine programs for Atari, C64 and Apple.
     Their price is advertized to be from $8.25 per month. Probably
     depends on machine you own. They type, run, test and mail you a
     disk each month.

     ANTIC maintains their own software library of mostly games and
     utilities that they have published in past issues. They also
     have some graphics, sound and music demo disks. Four or their
     games disks are now available on cassette tape. At $10 each
     plus $1.50 shipping, they are reasonable.

     Another company, LotsaBytes, is three disks of games
     and utilities and music that are supposedly public domain
     programs at $7.95 each plus $1.50 shipping per order. They
     call them selves a nationwide public domain copy service.

     Finally, I got an advertizement from a company called OVER SOFT
     in Michigan that have some real good prices. RALLY SPEEDWAY
     for $19.95 (cart.), PREPPIE for $9.95 (disk & tape) and
     PREPPIE II for $12.24 (disk & tape). These are all by Adventure
     International. Does anyone know is AI is in financial trouble
     and might be dumping these? Know anything about OVER SOFT?

Replies welcome and acknowledged.

[]
     Look for games and programs for the Atari to be discounted at various video, computer, and other stores. From what I've noticed several titles are incompatable with the new XL line of computers so they are being discounted. Although the Translator disk is available, not many people would buy a new program if it didn't work on their computer without the need to load another disk. Also the translator is unavaliable on cassette, and the time waiting for the translator to load would be frustrating.
     I've seen good games selling for under $10 and $20 at a couple of places so I am speculating that the above may be the reason. Has anyone else noticed the same.

xx <- two-footed bug stomp!
It's not just the games that don't work on the XL series that are
being discounted. A friend of mine just recently picked up some
Thorn EMI games (Sub commander, Pool, Darts, etc) at a big discount
($5 vs. normal $30 price), as well as CBS cartridges (Mountain King
is a wonderful game, and it was only $10). All of the above worked
on my 600XL. He bought them at KayBee Toy and Hobby in West Virginia
I believe, and I checked out KayBee here in Indianapolis and they were
having the same software sale. Also, some of the Software specialty
shops are dumping their Atari software (Missile Command was only $5
on cartridge), and they too work on my 600XL. I wonder what's going
on?

I have about 45 floppy disks that I no longer need. Most of them are Dysan
single sided/double density. Others are generic, elephant, etc. They are all
5.25" and I will sell them for $1.25 each. If you are interested, please
send me mail, and I will send them to you where ever you wish.

July 1984 ANALOG Table of Contents
(Games Issue)

Page Article

10 THE WINNERS
The staff of ANALOG pick their 7 favorite Atari games. (The winner might surprise you!)

29 BUZZ-ZAP
BASIC game for 16K Cassette or Disk. You're a bug being chased around by strawberries.

35 BACTERION!
ML Arcade game (generated from BASIC program; Assembler listing also given). Bacterial invaders try to remove the brain cells of world leaders (are we making an assumption here?). You must stop them. Very reminiscent of the arcade game "Ripoff".

51 WHAT IS IT?
BASIC children's game for 16K Cassette, 24K disk. For children 5-10 yrs old. Type in the name of the object pictured, with or without clues.

57 ALTERDOS
Short BASIC program that modifies DOS to run a file with any name you specify as if it was an AUTORUN.SYS file.

59 AUTO LINE NUMBERING +
BASIC/ML program (16K) that lets you automatically number your BASIC program lines as you type them in. Also keeps other useful info, such as number of variable names left and memory left, on the screen as you type.

72 CON TEXT
BASIC utility (16K) that converts files created by "Letter Perfect" and converts them to normal DOS files (so they can be used with other Atari word processors, such as Text Wizard).

82 STARS 3-D IN ACTION!
        A rewrite of the "Stars 3-D" Demo (Analog 16), written
        in ACTION!. If you haven't seen this demo, it is
        definitely worth typing in in either the BASIC or ACTION
        form.
86 BOUNCE IN ACTION!
        A rewrite of the "Bounce" demo (Analog 15), written
        in ACTION!
93 SCREDIT
        BASIC/Assembler program, Stands for "Scrolling Screen Editor".
        Needs 32K disk system. Edit a screen simply by typing in the
        characters and saving to disk...and allows you to scroll.

HARDWARE REVIEWS: None

SOFTWARE REVIEWS: Boulder Dash (First Star Software) -- "Exceptional"
           Universe (Omnitrend) -- "Richness of detail is unmatched"
           Seven Cities of Gold (Electronic Arts)-- "Engrossing"
           Movie Maker (Reston) -- "A winner"

PLUS: Reader Comments, "Griffin's Lair", "Basic Training", "Our Game"
      and "Boot Camp" Columns.

There are no "good" graphic adventure games for the Atari computer. All

of the good adventures are text only and they are all from Infocom. I do own about 8 graphic adventure games from Serria, Scott Adams, etc., but they don't hold a candle to the "real" adventure that comes on a disk from Infocom.

The above is the opinion of the author, and is correct.

Tom:

I tried to fill out the survey form, but found it impossible. Explainations are necessary. To the first question: For an excellent game, with challenge, Infocom is the only manufacture. If pressed I might add Scott Adams, but there are great flaws in the logic of those games.

Question 2: The Best Game Overall Game" In orger of my preference: The

"Zork" series, The "Enchanter" series, The "Mystery" series. These are all from Infocom.

Question 3: "The Most Difficult Game" This question can be taken either of two ways. One, the most difficult because of flaws in the logic, which is bad. Or, the most difficult because the logic is flawless and puzzles are difficult, which is good. On the first count, number one is Scott Adams followed closely by Serria On-Line. On the second count, my answer is Infocom, of course. In the difficulty field I will also include, Empire of the Over-Mind from Avalon Hill.

Question 4: "The Most Humerous Game" Again a game from Infocom, "Planetfall". But add any and all of the games from Infocom, they all contain both covert and overt humor.

And finally question 5: "The Most Realistic Game" What kind of question is this? Realistic? Adventure games are not realistic, they are escapeism. When I play an adventure game I want to forget about the real world. But, on the other hand, if you are asking if the game in question is real to the realm of Fantasy Role-Playing, then Infocom is the most realistic. And, the closest thing that I have seen to Advanced Dungeons & Dragons (AD&D) is 'The Temple of Apshi' from Epyx, and the 'Dunzhin' series from Screenplay.

All of the information is based on my personal experience after five years of playing AD&D, seven years of playing games on Unix, and three years of playing on my Atari 800.

The above is the opinion of the author, and is correct.

To question 5, what about the Wizadry series and Ultima III? I consider
Ultima III tens time better than Temple of Asphai. In at least one magazine,
both of these game are ranked the highest among role playing games.

<< Another line bites the dust >>

One day while driving home from UB, I noticed an interesting bumper
sticker on the car in front of me. It read, "I WOULD RATHER BE COMPUTING
THAN COMMUTING!", followed by the familiar Atari logo.

Since I am an avid Atari user, I have looked everywhere to find one.
Atari public relations and local computer stores were no help. I would
appreciate any information as to where I could obtain one.

Thanx in advance!

Elias

[Into the Bit Bucket]

I got a copy of the two games from Lucasfilm today. Please don't ask where they came from but I need some help on the rules. Neither game, BallBlaster or Behind Jaggi Lines, has any documentation and it is hard to try to figure out what in blazes is going on.

By the way, both of these games have incredible graphics and from what I've been able to figure out so far, both are really good games.

If only I could get all the rules, . . .

Scotty

<< Another line bites the dust >>

The repairman just informed me that a complete repair of the burned-out motor on my ATARI 810 drive would cost $300.

Now that I am in the market for a new drive, I would appreciate any information on ATARI 800 compatible drives. Specifically, I am researching the INDUS GT, RANA 1000, and ATARI 1050.

Stories of personal experience with any of the above will be greatly appreciated. Thank you!

Elias

<< And yet another line bites the dust >>

I agree with you completely - BallBlaster and Behind Jaggi Lines are two of the best action graphics games I have seen.

A quick rundown on how to play both:

BallBlaster

OBJECT: to catch the ball and score in the opponent's goal, by either shooting it in or by carrying it in. The farther away you are from the goal, the more points it is worth (1-3pts).

To select the game options, press the digit keys accordingly:

   1-4 selects computer as player 1. 1 is easiest, 4 is hardest.
   5-8 selects computer as player 2. 5 is easiest, 8 is hardest.
   0   selects two human player game

Player 1 is the top half of the screen; player 2 is the bottom (viewpoint is that of the playing piece on the game grid).

During play, the computer display always turns you toward the ball. When you catch the ball, the view is toward the goal posts.

It is possible to steal the ball from your opponent.

The game continues until someone scores a total of 10 points, or until time runs out. If the score is tied, play continues until there is a game winning point scored.

Total points are never greater than 10. For example, if player 1 has 9 points and player 2 scores 3 points, player 1 now has only 7 points.

The more points you accumulate, the smaller the goal becomes.

Behind Jaggi Lines

OBJECT: To rescue pilots who have crash landed on the alien planet!

As you fly over the planet surface, be careful to avoid the alien sniper laser cannons on the mountain peaks. Defend yourself by pressing the fire button.

Watch for flashing '+' on the surface; these are the pilots to be rescued. To aid in the quest, use the ship's radar scope and range counter to find each pilot. Land within a range of 2 or less, and turn off engines. The pilot will come running to the ship and knock on the door! Open the airlock and let him in. Take off and search for others.

The onboard ship computer will signal when the Mother Ship is present. This means the task is complete. Fire boosters and an automatic rendezvous is

engaged. Onto the next level of difficulty! (More of the same, just harder)

Keyboard Commands:

   A - Open Airlock
   B - Fire Boosters
   E - Engines On/Off
   L - Land
   <right-arrow> - Power up
   <left-arrow> - Power down
   ESC - pause

(WARNING: beware of aliens in space suits!)

Sorry to use the net for a personal note, but I've tried sending messages through the mail and don't seem to be having any luck. Albert, since you recommend Ultima III, does this mean you've played Ultima I and/or Ultima II? I've been playing Ultima II for a couple of months (it's the first and only adventure-type game I have) and I have managed to figure out virtually everything *except* how to acquire alternate transportation (i.e., frigates, planes, and rockets). I have been told by the barkeeps that: "Saylors wear blue tassles", "Pilots wear brass buttons", "Aviators use skull keys", and "Ankhs open space". I have never acquired any of these items on my (Z)tatus page, nor have I been able to find anyone or anywhere to get them from. Do you really need to have them? Where or how do you get them? I've been playing the same character for so long that my experience points have rolled over (at 9999), I'm topped out on attribute points, hit points, and gold, have more food than I could ever possibly consume, and more weapons and armor than I could ever possibly use. BUT I CAN'T FIGURE OUT HOW TO GET ON A FRIGATE, PLANE, OR ROCKET!! I've tried (O)ffering to everyone I can find, I've gone groping around in towers (although I have as yet never seen a dungeon), I've even been to Minax's castle. I've tried fighting my way to the frigates docked in Port Bonifice, I've offered gold to the Ithilian wench...frankly, Albert, I'm going just a little bit crazy! I've slaughtered entire towns and villages, I've wiped out all the meanies that guard the entrance to Minax's castle...I just can't take it anymore. Please, you've got to help me, if you can. I'll be watching this file for your reply. (Again, I'm sorry about having to use the net this way, but really, the mail system just doesn't seem to be making it.) Thanks.

"...living in a land of make-believe,
and trying not to let it show..."

diane

P.S. I seem to acquire an endless supply of Green Gems on my (Z)tatus page (in fact, they've rolled over twice), but I have no idea what to use them for or how to access them. Any ideas?

d.

I am glad to see that everyone else feels the same way about
Infocom games as i do.

No adventure can stand up to the excitement
and realism that Infocom puts into all of its games.

Of any of the games I have, Infocom is the only company
worth paying money for. If anyone is looking for a great
adventure to play, i suggest getting PLANETFALL.

          August 1984 ANTIC magazine TOC

page   article

10   WOMEN'S OLYMPIC VOLLEYBALL TEAM
          A continuing series on Atari's sponsorship.
12   RECALL
          This colorful game tests your ability to remember
          a sequence of colors and sounds, and is suitable for
          all ages.
18   LET'S PLAY PASSWORD
          This is a discussion of bulletin boards that require

a password for use. The article also contains a BBS update to previous articles.

20 IT'S MERE HORSE PLAY
This program handicaps race horses, using information taken from the Daily Racing Form. Users of this program must be familiar with the terminology of the track, etc. It will run on 16K machines if the fancy title page is left off.

26 ADD IBM OR CP/M COMPATIBILITY TO YOUR SYSTEM
A discussion of the ATR8000 add-on system.

31 DO MORE WITH DOS 2.0
Shows how to modify DOS 2.0 for dual density to use with your 1050 disk drive while waiting for DOS 3.0 to arrive.

36 DISK DRIVE SURVEY
Discussion of several different (but not all) disk drives that are available for the ATARI.

40 LUCASFILM LTD AND ATARI--CREATIVE PARTNERS
A good discussion of the games Lucasfilm developed for Atari.

44 EMBARK ON THE ROAD TO ADVENTURE
A look at three new adventure games from INFOCOM. (Enchanter, Planetfall and Infidel).

48 LOGO ACCORDING TO BOOLE
Using Boolean logic to make your programs more efficient.

56 PRODUCT REVIEWS
Hardware:
810 TURBO (Neanderthal Computer Things) adds double density.
APROM and SIX PACK (Walling Co.)
Software:
Panzer-Jagd (Avalon Hill)
Exodus: Ultima III (Origin Systems, Inc)
Safetyline (Maximus, Inc)
Spare Change (Broderbund Software, Inc)
Basic Building Blocks (Micro Education Corp. of America)
Dragonriders of Pern (Epyx)
Success with Math (CBS Software)

64 CREEPY CAVERNS (game of the month)
This is a fast-paced action/adventure game for one player. It can run on 16K machines if run in two parts.

71 CROSS-REFERENCE YOUR BASIC VARIABLES
This program creates a sorted list of variables from any SAVEd Atari BASIC program on disk or cassette.

77 RENAMER
This utility program lets you rename variables in a BASIC program.

83 ESCAPE FROM FRAGILE FLOPPIES
A discussion of the Amdek AMDC I and AMDC II disk drives. I has some nice features such as a parallel printer port and allows you to attach an off-the-shelf 5 inch disk drive if you don't have one now. Some software companies such as LJK, Broderbund, Synapse, Continental and Penguin already have or soon will release software in the 3 inch format.

90 THE CARE AND FEEDING OF FLOPPY DISKS
A beginners guide to care of disks.

Notes of interest:
     I mentioned last month that TRAK is coming out with a no-frills disk drive called THE CHAMP that is single sided all densities. They will also come out with THE CHAMP 2 which will be double sided, all densities. They also have now available the AT-D4, the first double sided, double density drive for Atari.
     Astra is advertising their new 2001 drive which is a double density, double disk drive (not double sided) that is supposed to be more reliable, quieter, greater capacity, faster read and write and easier data read than their 1620.
     Synapse had an ad for a demo disk the previews four of their hottest games for $4.00. It requires 48K.

<<ATARI has been sold to Commodore--- Shields Up!!!>>

I have a friend (really!) who got a copy of B-Graph but, alas, did not get any documentation. He has read the article in the latest version of CREATIVE COMPUTING but it didn't go into enough detail. If anyone out there has a copy of documentation, any help would be grateful. Oh, by the way, my friend is mostly interested in what statistical functions are available on B-Graph.

Thanks Again,

Scotty

I typed in the Macro.dos program from the June issue of Compute. How do I run it? I put it into a file called macro.dos. I tried a run:"macro.dos". The disk drive runs awhile and I get the ready prompt but the program doesn't do anything. I have the basic cartridge in while doing this. The Atari dos 2.0 is also loaded.

Any help will be appreciated. Also while I'm on the subject. I bought a 1050 disk drive and it came with dos 2.0. I read that Atari is supposed to give dos 3.0 to people that bought the 1050. I called Atari a couple of weeks ago and they confirmed this, but said they haven't yet started to ship it. Has anyone heard anything different?

August 1984 ANALOG Table of Contents
(Printer Utilities)

Page Article

 8 THE ATARI 7800
    Description of the new 7800 game machine and the corporate strategy behind it. ('Course, that was before Atari was sold....)
13 PROSET
    16K BASIC program to control fonts, margins and other programmable parameters on the NEC8023, Prowriter 8510 and PMC DMP-85 printers.
21 SELECTING YOUR PERFECT PRINTER
    Description of the major types of printers and help in determining what's best for you.
25 SPELLING CHECKERS FOR THE ATARI
    Review of (what else?) spelling checkers. Reviewed are Atspeller (APX), Spell Perfect (LJK), Spell Wizard (Datasoft).
28 AVALANCHE
    16K Cassette/24K Disk ML game (from BASIC program). A QBert-like arcade game.
51 MATT*EDIT
    40 Column, menu driven text and character graphics editor. Print'em with Epson w/Graftrax or Gemini printers. 24K BASIC.
59 GRAPH E'S
    Make quality plots and graphs (with labels and all) on your printer. 32K disk BASIC.

75 SPY PLANE
        BASIC game (24K Cassette/32K Disk). Fly a "Spy Plane"
        through obstacles to retrieve secret plans. Much
        like Caverns of Mars II.
83 THE ANALOG CARD FILE
        16K Disk. BASIC database program, simulates an
        index card file. Much like the Home Filing Manager
        from Atari, but no search capability. On the other
        hand, multiple files can be written to disk.
87 THE ANALOG ATARI PRINTER SURVEY
        A table describing the characteristics of various
        printers: Atari 1025, Axiom GP-700AT, Gemini 10X,
        Epson RX-80FT, NEC 8023A, Okidata 82A, Mannesman Tally
        160, and C. Itoh Prowriter.
95 THE FERGEE FILE PRINTER
        BASIC program (40K Disk) to print Bank Street Writer
        files in formatted form. Geared for NEC8023AC printer
        but easily modifiable for others.

HARDWARE REVIEWS: None

I guess the big Atari news is the sale of Atari. Both the video game and computer divisions have been sold; Warner is retaining the Coin-Op division. The TV news just said that it was sold to the man who formerly ran Commodore... though his name escapes me at the moment, is this the same guy who just left Commodore after umpteen years there? I wonder if the name Atari will still be used, or will Warner keep rights to that name. Judging from the internal conflicts between Warners and Atari, I think this is for the best...Atari should be owned by computer company, not by a giant entertainment conglomerate. Opinions?

On other things, a couple of words about printers. My computer is begging for a printer, but my pocketbook cringes at the idea, so I've been looking for a low cost (under $200) printer. I actually bought the Alphacom 41 printer for $90, but returned it the next day. The print quality was fine, the speed was fine, it could do graphics, but one thing I hadn't thought of made me return it...the paper. It comes with thermal 4.5 inch roll paper. I didn't think it would make a difference, but after disassembling a 30 sector file, I had a completely unmanageable strip of paper covering my living room floor. THe output resembles a huge supermarket cash register receipt. Besides, the printer is cheap but the paper (which is not that big a roll) costs almost $5.00 a roll. I will be getting an Atari 1025 printer. Seems the bottom fell out of the price, and they're selling around here for $189 (not bad for a printer listing at $550 and selling in the magazines for ~$350). I'd appreciate any feedback from people using that printer already.

Another random note. I have a Rana 1000 disk drive; it's my third and IT doesn't work any better than my first two (which went back to the factory). Since my warantee was up, I took the metal lid off to perhaps see why the drive was getting CRC checks all over the place when trying to read. When I took the lid off, the drive worked like a charm. Put the lid on, the drive went flakey again. Lid off, fine. All I had to do was APPROACH the drive with the lid, and it went bad again. I called RANA, and they knew about the problem... the motor was improperly shielded. They wanted me to send it back to the factory, but after 2 other turkeys, I decided to keep the drive and simply operate it with he lid off (I keep it covered when not in use). I've used it this way for about a month now, and I haven't had a single misread sector. If you have a RANA drive under warantee and it is acting flakey (like taking 5 minutes to load a program), you should call RANA. (By the way, does anyone know how to shield the motor? It's an MPI half height mechanism).

Atari was NOT sold to Commodore, but to the Ex-Commodore chief,
Jack Tramiel. Tramiel bought 75% of the Atari operation, not
including the coin-operated game assets or AtariTel. They
plunked down $75 million plus $140 million in senior debt and
$100 million in subordinate debts to Warner Communications.
Warner had bought Atari for $28 million back in '76. I hope
Tramiel can make a go of it. That's a lot of chickenfeed
they owe Atari.

/* . . . . . */

I'm interested in getting tiny C working on an Ohio Scientific
Challenger. For those unfamiliar with it, it's a 6502-based
machine. Therefore, anybody who's succeeded in porting to
an Apple, an Atari or a Pet could be very helpful. Specifically,
I need assembler listings, and any tips on interfacing to the
existing I/O system. Thanks.

I have purchased an Atari 825 printer with no cable or
documentation. I would like to obtain a Xerox of the
manual, instructions or whatever originally came with
it, as well as advice on the cable pinout, how to
interface without the 850 interface, and anything else
that would be pertinent. Can someone out there help?
             Thanks in advance,

My brother-in-law bought an ATARI 400 (against my advice) and now
has discovered that it has too little memory! While ATARI claims
it is not expandable, several independent vendors offer 40K RAM
expanders.

Does anyone have experience with these? If so, are they any good,
and can the ATARI BASIC interpretter access them (since that is all
he can program in!)?

!
Just to settle a few questions:

1. With the demise of APEX, what will become of Deep Blue C?
2. Is OSS C/65 an extension of the Cain Small-C?
3. Is the Hendrix (of "Small-C Handbook" fame, not Jimi) code available from some easily accessible source?

No, I haven't tired of Logo yet (my nMOS circuit editor is just about done), but I can't resist the urge to whack something together for the fun of it.

I've begun as a home business the publishing of a monthly newsletter
for people who have an interest in home computers but know little or
nothing about them. You are probably too sophisticated for this
newsletter, but you have friends who would enjoy reading it.

The newsletter is called The HOME COMPUTER Newsletter. Without a
lot of technical jargon and buzz words, it will bring the following:

- price information
- quality information
- new product announcements
- trends from the computer industry
- information for new users to help them feel comfortable with their
  new systems and to learn how to use the systems more effectively.
- my opinions and recommendations about home computer matters.
- answers to questions, etc.

The first issue, which is a pre-subscription issue (subscriptions begin
in October), discusses the following topics:

- Welcome to the Newsletter
- What the Newsletter will contain
- The home computer market

  o News flashes
  o Protection from lightning
  o What are home computers?
  o Some good reading
  o Price trends
  o In the next issue (news flashes, what to do with a home computer, how
    to select a home computer, should you buy mail order or from a store,
    and should you buy a "complete package" or individual components.)

If you feel your friends would be interested in looking at the paper,
please pass this information on. The yearly subscription is $7.00 in
the USA and Canada. A sample issue can be obtained by sending 25 cents
and a stamped self addressed envelope. The address is:

The HOME COMPUTER Newsletter
P.O. Box K126
E. Pepperell, MA 01437

Thanks!

From what I understand about the XL series, all you have to do is hold down the <OPTION> key and the system skips the BASIC ROM. If that is not the problem, you may look into the Translator Disk available from Atari.

A recent note referred to the demise of APEX. Is this really true?

Thanks,

Burns

Just in case there is some confusion about what Mr. Malloy said,
he meant that you should hold down the <OPTION> key when POWERING UP
your XL computer, so that the BASIC ROM will be flipped out.
Once I had done this on my computer, almost all (>95%) of my software
worked flawlessly. As well, since the <RESET> button on the XL
computers attempts to do a 'cold start' (please someone correct me
if I am wrong), if the program you are executing does not trap
<RESET>, you can usually hold down the <OPTION> key, and hit <RESET>
to boot the disk and load a different program (assuming you have more
than one program on the same disk, or have swapped disks by then!).
The above procedure will save wear and tear on your power switch, but
does not always work, especially in the newer programs which attempt
to be smart and trap <RESET>.

It's true! APX was eliminated by Atari in one of there cost cutting
several months ago, even before the current buy-out by Jack T. I
haven't heard what has happened to the programs but there was rumors
that a seperate company would be set up to sell the best of them.
Now, who knows? Has anyone heard anything new on the direction that
Jack will take with Atari?

I am looking for a pointer to a program to remove REM statements from
a BASIC program. I recall seeing a short article, titled "NOREM" I
believe, but have not been able to relocate it.

Side question: I've typed in GRAPH E's from the August ANALOG, pass the
DCHECK test, but when I RUN, if I turn traps off at about line number 105,

I get an out of memory for this GRAPHICS mode 8 error message. Has anyone else had the same problem?? (I am running with 48K Bytes of RAM)

Thanks.

I am looking for info on reconfiguration commands for various reconfigurable disk drives like the 1050, Percoms, Indus, ... What I'd like to know is how to find out what configuration their in, and how to put them in the configuration I want. Any info would be most appreciated.

Does anyone know if it is in anyway possible to get a printer driver for the Atari 1027 Letter Quality Printer on tape? I have a choice between buying a disk drive or a printer (the 1027 being the only one available to me), not both, and Atariwriter is not very handy without a printer, eh?

Scooter!

Not only is Archon fact (and a wonderful game), but Archon II is
out! I haven't got a chance to play it, but it looks like there
are some additional or changed characters, as well as
improved graphics.

In my review of "Graphics Animation Primer" I stated that the
publication of the book was held up because of a dispute
between the publisher and the authors. I got this information
from the McGraw-Hill bookstore in New York City.

However, I have found out (from "reliable sources") that
the publication was held up because the book, as originally
written, was simply too large (remember, the FINAL ended up
> 500 pages).

I apologize and stand corrected.

September 1984 ANTIC magazine TOC

page article

13 UNLOCKING THE 56 GRAPHICS MODES
An introductory article on the full range of Atari's graphics modes. It includes a BASIC program that displays all 56 modes.

16 TELLING TIME IN PILOT
A simple program to teach children to tell time using three difficulty levels. Needs Pilot language.

21 NETWORKING NEWS
Continuing articles on BBS's.

26 ATARI ART
Modern art on a dot matrix printer.

29 DRAWING FUN
A joystick drawing program that uses Graphics 10, a nine color medium resolution GTIA mode. Needs GTIA chip.

32 ANTIC'S MODE 3
Here's how to modify Atari's text mode to display video lowercase letters with real descenders and subscripts.

37 COMPUTER GRAPHICS PRODUCT SURVEY
A long article that covers both software such as MICROPAINTER and PAINT and hardware such as graphics tablets, light pens and printers to make hard copies.

48 PRICE'S COLOR PICTURE PAINTER
This program lets you change all four colors on every scan line in pictures drawn with most graphics programs that use

Mode E, Atari's high-resolution four-color mode. Disk Drive is required.

57 EASY GRAPHICS CONVERTER
This program converts picture files between different drawing software products such as joystick, light pen and KoalaPad. It allows you to use MicroPainter to make backgrounds for Movie Maker files, etc.

64 ROTATE YOUR PLAYER
This article demonstrates some of machine language's special capabilities. Needs both BASIC and ASSEMBLER EDITOR for full effect.

66 CUSTOMIZING BASIC KEY FUNCTIONS
(I quote here) A devilishly clever technique for setting up two-keystroke "function-key" abbreviations that will enter repeats of lengthy commands into your program. BASIC and a disk drive are required.

70 OLYMPIC DASH (game of the month)
This simulation of the 100-yard dash is ANTIC's first machine language action game. (like games out of ANALOG mag) It is a two player game requiring two joysticks that runs on all Atari computers.

76 PRODUCT REVIEW
Hardware:
Advanced Programming Techniques For Your Atari (book)
Atari Basic Faster and Better (book)
Software:
Rainbow Walker (Synapse)
The Seven Cities of Gold (Electronic Arts)
Pitfall! (Activision, Inc)
Drol (Broderbund)
Carrier Force (Strategic Simulations, Inc)
Nato Commander (MicroProse)
Universe (Omnitrend)
Codewriter (Codewriter Corp)

87 COPY MATE
A fast easy disk-sector copier that requires ASSEMBLER EDITOR. XL computers need the translator.

98 FADER--A CLASSY VIDEO "SLIDE SHOW"
A unique dot-by-dot "fade" effect that can be combined with picture files created in MicroPainter format will give a professional looking slide show.

Notes of interest:

I didn't receive my subscription copy of ANTIC until Monday although I saw the copies on the news stands over the weekend so I apologize if most of you already know what articles are in this issue. I am sure there are some of you that will still benefit from this information.

I've played the C64 version of Archon; the Atari version should
be similar. Like most Byte reviews, their bit on Archon is
mostly empty hype. The potentially interesting strategy part of
the game is dominated by the not-very-good arcade-like part.
Playing against the computer is NO FUN because unless you are a
real arcade wizard it will slaughter you in short order.

I noticed a bit of discussion about double density problems with the Rana 1000 disk drive. A few months ago, I purchased a Rana 1000 disk drive for my Atari 800. It worked fine in single density mode, but when I converted my OSS DOS XL to double density, I had many problems.

First of all, after powering up the drive, it took a minimum of 10 minutes to boot the double density diskette. When reading files from the disk, it became evident that many retries were required. I used the internal diagnostics in an attempt to discern what the problems were. The drive failed to format a brand new diskette 4 times in a row. I tried another diskette and it formatted correctly on the 2nd try. Other tests gave similiar results.

The problem as I understand it is evident only in the Rana 1000 drives with the serial number prefix ATH. After talking to Rana about my problems, I sent the drive back. They sent me a new drive which also had the ATH prefix. This drive had the same problems as the first drive. I sent this drive back also and finally received a drive with an ATM prefix. THIS DRIVE WORKS WONDERFULLY! It boots up immediately with no retries and files load very quickly.

So, if you plan on purchasing a Rana 1000 Disk Drive for your Atari system, make sure the serial number prefix is ATM.

[Is this bug still alive?]

I'm posting this for my father who has an 800 but no access to this net.

He has an 800 with 1 disk drive and a Gemini 10X printer running out of the
daisy chain behind the disk drive (some kind of Ape Face Printer Interface
I'm not familiar with).

Now he has a 300 bps modem that he wants to use without losing any of his
present equipment. Is there any kind of interface that runs from joystick
ports 3 & 4 that terminate in a RS-232 connection?

Any and all information on connecting Modems to the Atari are welcome.

Thanks,

Scotty

Three cheers for Home Computer Magazine (the old 99er for TI)
They offer tapes or disks of everything in their magazine for
a quit reasonable price (3.95) for all the pcs they cover.
At least that is what their latest offer is. They also have
all the stuff from back issuses available. Plus, they put
out one of those THE BEST OF books which is also available
on tape or disk. They now cover IBM PC, Commodore, Apple IIe,
and TI if your interested.

According to Wednesday's Wall Street Journal, Atari is laying off
250 to 260 white-collar workers while adding 50 to 60 people to
its sales, marketing and engineering staff.

They also mentioned that sales have been slow for the 600XL since
they raised the price but that they need the increase to break
even. If they can't sustain sales at that price, they will consider
dropping it altogether. The 800XL has been selling well, even with
the price increase.

As a further cost cutting measure, they have announced the end of
the Atari Program Exchange (apx). This is a shame since the apx
has some good programs. There is no word on whether someone else
will pick up the programs.

Just a few comments to follow up on Kit Kimes' message.

Atari made a bad pricing mistake with the 600XL. Since the 600XL list is about $100 less than the 800XL and the 64K expansion module costs about $100, it doesn't take too much reasoning to buy an 800XL in the first place and blow off the expansion unit. One can only assume that Atari marketing types had their brains addled by too many episodes of the "Dukes of Hazard" or "Riptide." :-)

The amount of technology packed into the $250-$300 800XL is still pretty amazing. The AtariWriter and Logo cartridges look like winners to me. AtariWriter, by the way, has just moved into the Billboard Top Ten Software chart.

It's truly unfortunate if the program exchange is dropped. Perhaps Atari feels that the "regular" software houses are now producing enough product to keep the XL line alive.

Would anyone care to speculate on future Atari machines? I fully expect a Smalltalk (or some such) expander which uses an XL as the graphics engine.

I am looking for the cheapest mail-order price on an Indus GT disk drive
which I could order for my Atari 800XL. I would like for people
to reply by private mail if they wish, but I feel that this is of general
interest to the net. I realize that others have posted prices in the past,
but as this is a new product, the prices may have fallen further.
Thanks for all replies,

Jerry Zarycky

I know that killing the pterodactyl in Atari's version of Joust
for home computers is no easy task. You have to try to spear it in
the mouth. However my brother, and I have discovered that you can
kill it by flying into it from the rear, pretending the tail is the
mouth. I have not perfected it yet, but I think that if you do not flap
when you hit it, then you will kill it, otherwise you die.
If anyone else has any new ideas, please post to the net. Thanks.

It's all a matter of timing. Trying to kill the Pter. while it's
charging/screeching is impossible but just before and after is easy.
You must stick your lance EXACTLY in the center of its mouth or
between the tail and feet (basically in the same horizontal plane).
The top of the screen is the best place to wait for it and fly
backwards slowly (reverse direction between flaps and keep the joystick
straight after that) until you get the hang of it.

Expert level forever...
Phil

Some groups are talking about listing the indexes for current magazines the are pertinent for the group. I decided to try one to see how it goes over. Following is the index for April, 1984 Antic magazine with a synopsis of most articles. If you like it, let me know.

April 1984 Antic Index

Page Article

14 Biomechanics at the Olympics
Atari is sponsoring the U.S. Women's Volleyball team
18 Talk to Your Peripherals
This article's listing is a subroutine that you can add to your own BASIC programs to gain control of functions that are normally accessible only from DOS.
22 Math Wizard
This program presents a basic arithmetic drill in a colorful, arcade-style format.
30 Light Pen Doodle
This drawing program requires BASIC, 16K, and a light pen. The program runs on all models of Atari Computers.
35 Safe Space and Large Letters
This article explains where to locate machine-language programs when using the Logo programming language, and how to create text displays with large letters.
37 John Victor, Computer Educator
Interview with founder and head of Program Design, Inc. (PDI)
50 Creative Programming with Player/Missile Graphics
This article explains how to use P/M graphics in non-standard ways.
53 Matchbox Tic-Tac-Toe
This program serves as an introduction to the fundamentals of artificial intelligence.
58 Atari Controls Your Environment
A computer-appliance interface is a device that lets you control appliances and other machines with your computer. You must build the circuit to use the programs in this article.
62 Memory Window

This program lets you view any portion of your computers memory on the screen.

67 Little Brother Grows Up
This article explains how to adapt an Atari 400 for audio and video output. It involves wiring and building a circuit board.

69 Wheels within Wheels
A short graphics program that draws various patterns on the screen.

72 Electronic Birthday Card
A computerized birthday card celebrating Antic's second birthday. It can be modified for others.

77 Risky Rescue (game of the month)
This is a maze style arcade game.

82 Update Disks with NOTE and POINT
This article shows how to use NOTE and POINT to update data files on disk.

85 Arena Psychotica (bonus game)
This very challenging arcade game pits you, as a race car driver, against a monster that leaves a deadly trail.

90 Past Page Six
Safe storage areas for machine-language subroutines are discussed. For use only with DOS 2.0s and requires assembly language.

103 Tangle Angles
A regular feature aimed at cassette tape users.

Antic Magazine now has over a 100,000 readers. They will not have a May issue because they want to bring their cover date into line with other magazines.

I am ready to buy a disk drive for my 800. I've narrowed the choice down to one of two and would appreciate any coments concerning either one to make my final selection. The choices are the TRAK AT-D2 or the INDUS-GT. The INDUS advantages are that all the after market sofware runs on it, also, it comes with a word processor and spreadsheet software. The TRAK has a printer port with a 4K buffer. Does it come with any software in the base price and can it work with most of the after market software. If I go with the INDUS what would a buffered printer interface run me.

Thanks in advance,

How's this for a grabber? I recently purchased one of these things because the buffered printer port seemed to provide the finishing touch to my son's system without going overboard. As I told the guy in the store (who pointed out that there were bigger and better ways of expanding an Atari 800 system), if I want a serious system, I'll go out and buy one. Well, folks, I just proved once again that there's one born every minute.

The disk drive works fine. The only problem here is that the literature (and the dealer, possibly mistakenly) implies that the "Turbo software", which comes with the drive, is a DOS. WRONG!! You still need Atari DOS to boot the thing. Disappointing, but not too big a deal.

Here's the real kick in the teeth. The dealer tries to

sell me a printer cable. Now, I have a real antique of an MPI 88T printer in which both the parallel and serial inputs are terminated in headers on the pc board. I'll make my own, thank you, sez I, knowing that no way will the standard cable work. HA! Nowhere in the documentation does it give the pinouts for the 34-pin edge card connector.

Naturally, I call Trak (on their toll-free number, of course). First, the gal on the other end tries to get me to call their tech staff long distance. No sale. Then another gal, presumably in charge, gets on the phone to listen to my problem-- "that's better, I think to myself". Not on your life! Upon hearing my request, she informs me that they do not give out the pinouts for the printer port. If I have some other kind of connector than that which matches their cable (36-pin Centronics), I could see my dealer, who can evaluate my request, contact Trak, and maybe, just maybe, they can assemble a custom cable for me. And we all can imagine what that will cost.

Moral of this sad tale: With an attitude like that (as if parallel printer connections were some big proprietary deal), I wonder how accommodating they would be if I had a really big technical problem. Caveat Emptor, prospective buyers.

Sadder, but maybe wiser,
Chip

p.s.

Unless someone out there has already solved this problem, and can mail me the pinouts, I'm going to be forced to buy their cable, map the pinouts to the 36-pin connector, and then return it because, surprise, it won't fit. Unfortunately, the only one who will be inconvenienced (besides me) is the dealer. Maybe I'll give him a copy of the pinout map so he can get into the custom cable business himself!

[Living sacrifice to assuage the gods of first lines . . .]

Does anyone know about hard disks on an Atari (specifically an 800, but it
should not matter which)? I have never seen an ad or other reference and
would really like to get one if they exist.

Replies by mail, please - summary if appropriate.

A company called Compucat carries the Indus GT drive for $325.60. They
advertise that they sell hardware and software for cost + 10%. There is
a 5% shipping charge for all orders. Their address is:

          COMPUCAT
          24500 Glenwood Highway
          Los Gatos, Ca. 95030

          (408) 353-1836

The phone is used for computer bulletin board from 6 PM to 9 AM daily and
all day Sat and Sun. They have an on-line catalog and public domain
programs.

I haven't ordered anything from them and don't know how service would be
but they were very pleasant on the phone.

The 34-pin edge card connector on the TRAK AT-D2 disk drive is pin-to-pin
compatible with the first 34 pins of a standard 36-pin Centronics parallel
interface (as is used on Epson and most other printers) so that ribbon
connectors can be used on both ends. I don't have the Centronics pin
assignments readily at hand, but I can supply them if you can't find them.

Some of the early drives (before ~ Jan) also had problems with:
   a) garbled graphics output
   b) drive motor sometimes refuses to shut off
   c) won't format the 'flip' side of a disk
Problem a) can be fixed with a new ROM which TRAK will supply free of
charge. Problems b) and c) require some added jumpers and trace cutting.
These problems have all been fixed in the current models, I'm told.

I was wondering if anyone had any more news/rumors about the expansion
capabilities of the XL line. In this month's (April) COMPUTE!, Bill Wilkinson
writes in his Insight:ATARI column about a supposed April Fool's joke.
He writes about an intelligent peripheral interface (card cage)
which could support high-speed modems, parallel printer
interfaces, music synthesizers, parallel disk drives (which would run app.
10 times faster than the current serial ones), and even a winchester hard

disk drive. He claims that this system would be second in expansion capability only to the Apple II systems. Has anyone heard anything about this expansion interface? As a side note, if one bought one of the current serial disk drives, is it possible to take advantage of the increased speed of the parallel port, or is the "serialness" an inherent property of these disk drives?
Replies to the net would probably be most beneficial.

     Isnt this the same guy who described the Cobol cartridge to plug into the atari, last april issue? The whole thing was a joke, and I think the very last line of the article said so. The basic situation is that using the 19.2k baud provides a serious upper limit on the I/O rates. This is not as bad as might be expected, as most micros are obtaining about 5k baud even when using a parallel interface, if you dont believe it, time downloading about 20k bytes into the box and see what happens. The floppy firmware is just not tuned for the real speed that the controller can support. There was consideration of a parallel interface to the atari line, but looking at the advantages, the idea was shelved. (This was an independent hw outfit.)
To upgrade the current drives would require ripping out the disk controller

card in each drive and replacing it, not a cheap option.

I am interested in buying an 80 column card for my 800. The only two
I know of are the ones from BIT 3 SYSTEMS and Austin Franklin. I would
appreciate comments concerning reliability and compatibility with
existing software packages. I am mainly interested in word processing
and a terminal emulator. Also does anyone know of build your own
bare board 80 column card? The cheapest I've seen the Bit 3 Systems
board is $219, a bit steep. Thanks in advance.

My local computer outlet informs me that Atari will release

the 1450XL after all. Also on tap is a Laser disc based machine for which I have few details. Can you imagine how much software you can get on a laser disc!

The same source also reports that shipment of Commodore 64 products has dried up. Could the wolf be at Commodore's door now?

...

Has anybody used Rana's new SmartDos operating system? The stores here have just received them (in limited quantities, apparently). I've glanced through the manual, which seems quite good (as opposed to Rana's disappointing Drive manual), and it looks like the OS is very nice (user friendly, etc, etc, etc, yawn). Looks like it also comes with some nice utilities (speed checker, sector copier, and other things people already have). How is the compatability with Atari Dos, OSA, etc? Rana really has a nerve...the price tag is 45-50 dollars, whether you have a Rana drive or not. And apparently the $45 is DEALER's cost. (If I do buy it, I'll post a review to the net).

Also, I understand that Rana has "upgraded" their newer drives, and now offers a 1 year warantee (mine, a fairly early model, has a 90 day warantee. I've had to use it; the drive I have now works like a charm, but this is my third try). Aside from the warantee difference, are there any functional or cosmetic differences?

Layoffs be damned, Atari's still
the best machine around!!!!!!!!!

()

Welcome to Chapter 2 of "Young Man Starts a Potentially Troublesome Business".

As you will recall, young Tim Ebling (my friend) is offering a service
to subscribers of "Compute!", "Antic" and "ANALOG"; he types all the
programs in each months issue of those three magazines onto a disk,
and sells it to you. A number of you have contacted me and suggested that
I advise him that there may be some copyright issues here. Well, there
are, and we have discussed it with a lawyer, and here is Tim's response:

"   I realize that there have been many misunderstandings of
     exactly what is illegal and what isn't. I've checked with a
     number of lawyers, and they have agreed that what I'm doing
     is legal as long as the buyer owns the issues included on the
     disk. With each order, I send a 'certification sheet' with
     which the buyer certifies that s/he owns those issues. Remember,
     what I'm doing is strictly a typing service; I respect all the
     copyright laws for the magazines and the software. I have no
     intention of piracy.

     Also, due to the higer than expected costs of mailing, a single
     Magazine Disk costs $5.50 and a 12 month subscription costs $65.

     Thanks for your concern,

          Tim Ebling
          Magazine Disk
          1501 River Loop #1
          Eugene, OR 97404
          (503) 688-6872   "

Well, there you have it. Right form the entrepreneurial source.
If you have an Atari machine, you might give him a try. IF you own
those magazines, however. I think it'd be worth $5.50 to have someone
else type all that stuff in for me.

CAVEAT: My employer (Tektronix) does not endorse the above service;
     I am supplying this information as a public service. It is
     my opinion only. (I think he's a smart kid with a bright future).

It don't mean a thing if it ain't got that swing,

I've noticed that on my properly backed-up version of Solo Flight (for
the Atari... I dunno if yours is on the Atari as well) will about once
out of every fifteen times go into slow mode. I have an 810, and the
backup could not be made using standard DOS disk copying (they use
redundant sectoring on this one... good thing I have hardware-assist
widgets to make my backups!).

I think that what they did is made the s/w on the disk with redundant sectoring, and then put a hook into the program to go ahead and boot up on a "copied" disk, but run the clock at a super slow rate. Different from the other protection schemes, which simply go bonkers on the copies.

If you wanna make a backup of your Solo Flight disk, go find someone who has a Happy Drive, an ATR8000, or the Chip (all are hardware assists to do image bit-for-bit copies of disks).

Flames about the pirating possibilities with a bit-image copier can be sent to /dev/null. People have an honest need to make backups. (Curse "Electronic Arts" for using sector skewing on their latest releases... even the Chip has a heckuva time with those!!)

I noticed an advertisement for Concorde disk drives in an Atari magazine. The Concorde drives are double-density, and double sided, selling only for about $380 at this place (whose name escapes me). This is also the price for the so-called master drive. You can hook up additional "slave" drives (up to 3) which cost only about $310, and are also DD and DS (each drive can thus hold 384K). My question is: has anyone heard of these drives, and does anyone know if they are reliable, or how they work the master-slave combination?
Replies to the net would probably be most beneficial.

Jerry Zarycky

[]

Below is the table of contents and synopsis of the articles appearing in the June 1984 issue of ANTIC magazine. They did not produce a May issue. Thanks to all who took the time to write and say that they thought this was a good idea. I got no negative responses. If someone else wants to put the TOC of other magazines in this group, go ahead. This is the only one I am going to do, even though I read all the magazines that apply to Atari, this is the only one I subscribe to.

June 1984 ANTIC Table of Contents

Page Article

10 EVOLUTION OF THE XL COMPUTERS
Explores some of the changes in the new computers.
16 ALPHABET MUSIC
This is a short educational game for young children using musical notes. It runs on all Atari computers with all memory configurations.
20 TALK TO YOUR ROBOT
Third in a series. Requires FORTH language.
27 PROFILE
Interview with James Levy, head of Activision.
33 ANATOMY OF AN 800XL
An inside look at the new computers.
38 EXPLORING THE XL

This article looks at at number of interesting aspects of Atari's new line of XL computers. If you have an XL and Synassembler, the accompanying program listing will convert Synassembler so that it can run on your XL machine without the Translator program.

41 SCROLL YOUR WAY TO THE TOP
This article serves as an introduction to the graphics animation technique called scrolling. Requires BASIC and 16K. It runs on all Atari computers.

46 USE BASIC TO ANIMATE
This article, the first in a two-part series, shows you how to control Player/Missile graphics from BASIC. The accompanying BASIC program is a 4 player, tank battle game. It requires 32K. Modifications are included to run on XL machines.

54 COLOR FINETUNER
This article presents an assembly-language program, with a BASIC loader, which lets you change the contents of the color registers--even when a program is running. Requires BASIC and 16K. Must use Translator to work on XL machines.

58 BASIC--A VARIABLE APPROACH
This article presents a variable-list utility that aids in the debugging of BASIC programs. Runs on all Atari computers but requires a disk drive, printer and 16K.

62 COMPUTER FURNITURE
A round-up of stands, desks, etc.

71 ESCAPE FROM EPSILON (game of the month)
Escape from Epsilon is a challenging arcade game for one player. Requires joystick, BASIC and 16K (Cassette) or 24K (Disk) and runs on all Atari computers.

87 SHORTCUTS TO SUCCESS
This article explains the use of macros in assembly-language programming, and supplies a library of macros for graphics programming. To use the accompanying programs, you must use MAC/65, a macro assembler from Optimized Systems Software (OSS). The macros and demo program will run on any Atari computer.

This issue also includes some regular columns and reviews and previews of new products.

Kit Kimes had a good idea in posting the ANTIC table of contents, so I'm volunteering to post the monthly table of contents from A.N.A.L.O.G. (MY subscription!). I'll even steal Kit's format. Anyone for Hi-Res or Compute?

By the way, the last issue (#19) of ANALOG is dated May/June, for the same reason that ANTIC skipped their May issue.

Ben Weber pyuxn!benw

May/June 1984 ANALOG Table of Contents
(Telecommunications and the ATARI theme)

Page Article

7 DARKNESS AT NOON
     A critical look at the financial and managerial problems
     that Atari is currently having.
30 SUPER SINE
     A BASIC program to plot up to 8 simultaneous trigonometric
     functions in graphics 8. Also squeezes 8 colors out of
     graphics 8.
35 BATTLE IN THE B-RING
     ML Arcade game (generated from BASIC program; Assembler
     listing also given). Retrieve an alien ramjet from
     the debris laden B-ring of Saturn
46 BULLETIN BOARD SYSTEMS
     A listing of 37 BBS's for the Atari
48 A LOOK AT MODEMS
     A brief introduction to modems and computer telecommunications.
49 PRINTER INTERFACE ADDITIONS
     Mods to the "Low Cost Printer Interface" article from
     ANALOG 16 (construction of a low cost Centronics interface)
     to work with Cassette based systems.
51 PUBLIC DOMAIN TERMINAL SOFTWARE
     Descriptions of publicly available terminal programs,
     such as COMM40, JTERM, and TSCOPE.

54 THE SATURDAY NIGHT SPECIAL
        Subtitled "...or How to write a modem program in one day".
        A BASIC program that generates a quick and dirty ML
        terminal program.
57 TOUCH-TONE DIALER
        Short BASIC program to generate Touch-Tone tones from
        a given phone number.
63 EDUCATIONAL COMPUTER GAMES
        An overview of what makes an "educational" computer
        game good or bad.
74 SO YOU WANT TO BE A SYSOP?
        The ups and downs of setting up your own Bulletin Board
        System
81 DEFAULT
        A short BASIC program that lets you change the
        default screen colors and margins, even through
        System Reset
84 SIEGE
        A BASIC game (16K Cass/24K Disk) in which you drop
        boulders on hoards of invaders trying to climb the
        walls of your castle.
93 SOLID STATES REVISITED
        New reader submitted shapes for the Solid States
        3-D program (ANALOG #16). Includes an "A" and
        a nuclear reactor cooling tower. Also includes a
        routine to automatically rotate an object.

     I know that you asked for a program in Basic that does not use
recursion. But, I just could not resist.
     Using Logo with recursion makes it so much easier.

                    Down with Basic, long live Logo.

Sometime in January there was a query on this network on
using a TI Silent 700 terminal as a printer without connecting
it to a Atari 850 interface for use with an Atari 800 computer.
I never saw any response and I'm interested in this possibility.
If you have any information, I would greatly appreciate a response.
I'll be happy to summarize any response I receive and post to
net.micro.atari

Thanks in advance.

[]

In the June issue of Analog Computing, there is a brief mention of a
Serial Bus Modem Adapter from Advanced Interface Devices, that can
be used to connect most modems and RS-232 devices to the
Atari over it's serial bus without an 850 interface module. This was
in the new products section and had an accompanying picture showing what
looked like a cable, a manual, and software on floppy.
The Question: has anyone had any experience with this device and (as usual)
what was their experience with it. It comes with software, but
is this just a device driver, or must a special program be used to utilize
the device (ie. for different baud rates and other configurations).

Also in that issue was a brief review of OSS SuperBasic cartidge. OSS Super
cartidges uses bank switching within the cartidge (multiple ROMs software
selected and mapped to overlapping address spaces) to allow, for example, a
12K ROM that uses 8K of address space. Any way the article said that the
cartidge was upward compatable with Atari Basic, and SIGNIFICANTLY faster.
The Question: has anyone had any experience with this device and (again)
what was their experience with it. Also does anyone have execution speed
comparisons.

Replies can be sent to me or posted if deemed news worthy.!
I will summarize and post [assuming I get replies. This news group has
been kind of dead, but that's another article].

[]

According to the Wall Street Journal, May 9, 1984, Atari announced the forthcoming release of two new video games that have been developed by Lucasfilm Ltd. They have been under development for nearly two years under a joint venture between Atari and Lucasfilm.

Atari executives said the games are among several new products, including new video game and computer hardware, that the company will introduce this year. Atari is hoping the Lucasfilm video games will help rekindle consumer interest in video games. One official said these games are the most significant thing to happen in video games since "Pac-Man".

The games are designed to be played on existing hardware systems. They use more sophisticated computer graphics and animation techniques and have more of a three-dimensional appearance than most existing games. They use computer-generated music and sound effects.

The games are named "Ballblazer" and "Rescue on Fractalus" and will retail for about $35. That is a little hard to believe since most of Atari's new games go for $49.95 retail.

I plan to attend the Consumer Electronic Show here in Chicago next month. I'll report on what's new for Atari.

An recent article about a printer interface in A.N.A.L.O.G. 16 interested
me. I would like to try and get the back issue but first a couple of
questions. Does it connect to the joystick ports or to the serial
port? Does the article include driver software? Has anybody tried
it and how does it work? Thanks in advance.

Okay, I'll tell. I've seen early versions of both the lucasfilm games, and played one of them quite a bit. They are tentatively called "Behind Jaggai Lines" and "Ballblaster". They are without any doubt the greatest games I have seen on any home computer system. BJL is a shoot the aliens game, and BB is a bumbercar soccer game. Both have 3-D graphics, with the screen looking like a viewport into the real world. BJL has a better flight simulator than the ones running on the IBM-PC. BB is fast, exciting and an incredible amount of fun. Definitely the biggest thing since pacman. You can stop wondering.

I too have played both games. Definitely HOT. Jaggi still amazes me
about the number of necessary calculations in realtime necessary to get
the picture on the screen. I dunno how they can even *approach* the
computational complexity that it appears to have with the poor ole' 6502.
Sounds, talk about sounds! The ship flying through space makes great
sound stuff. The music on Blaster is really great (not the standard arcade
quality music either... these guys go full out). And the pace of Blaster
(even on you vs. the machine) is something that even my world-class video
champ brother Ron (who scored the record for Defender @ 25M points last
year) is challenged by. It's hard to find a game that keeps Ron interested
any more... Blaster succeeded. That's a statement in itself.

Those guys at Lucasfilm are pretty hot. I hope they come out with LOTSA
good games that astound and amaze me as much as Star Raiders did 5 years
ago. (How do they do those things with the Atari processor?)

The Spring '84 issue of Atari Connection has an article on
the new games from Lucasfilm. As mentioned in an earlier
message, there are two games: a rescue game and a surreal
ballgame. The rescue game is a flight simulation over a
changing landscape. The quasi 3-D images are produced on
the fly using fractals. The ballgame has a split screen --
one for each player. Again, it is a "point of view" game
and the windows show the view from your "Rotofoil" cycle
and your opponent's machine. The object is to send a ball
through moving goal posts while trying to juke your opponent.
It features a progressive jazz score.

The game was tested and previewed on an Evans & Sutherland
Picture System (which is a pretty "real" animation tool.)
Once the concept was frozen, much of the development time
was spent cramming the games into 32K ROM's. (Baskin Robbins,
anyone?)

I've been relatively disinterested in video games during the
last 2-3 years, but I'm really looking forward to these games
just out of "technological" curiosity. Remember, Atari sold
a lot of 400/800's solely on the strength of "Star Raiders"
which now looks a little passe.

I too have seen a preliminary version of the new games.
Best games for the 5200 I've ever seen - by far.
Hard to believe the 5200 is capable of what these games make
it do.

    There was a bit on "Today" last week about the Lucasfilm/Atari
games. What makes it interesting was a brief interview with one of the
game designers - Peter Langston (better known for his work on "empire" and
various other Unix games)

Does Tandon make an Atari compatible disk drive?

What is the format for Atari disks? (i.e. density, #tracks, #sectors)?

TIA!

The Indus GT disk drive for atari computers has a Tandon drive
mechanism in it. I own one and so far I am very pleased with
it. It is an extremely high quality unit not only the mechanism
but the electronics and packaging. It comes with an operating
system that is compatible with single density, double density
and Atari's new dual density modes. From talking to other owners
all after market software boots up properly on it. It also comes
with a decent word processor, spread sheet and data base software.

I recently wrote a modified version of Bill Wilkinson's "M"
driver, which allows 64K XL owners to use the RAM below the
Operating System and BASIC. I call the modified version MDRIVEXL.
Like the original "M:" driver it allows you to treat RAM memory
like a regular device (the "M:" device). Unlike the original "M:"
driver, which stores bytes between the display list and your
BASIC program, MDRIVERXL stores bytes under the O.S. and, if you
are using built-in BASIC, under BASIC. It automatically switches
ROM in and out by setting the proper bits in the PORTB register.
You can store over 22,000 bytes there and use all the regular
I.O. commands (OPEN, INPUT, GET, ENTER, RUN etc.). I have added
System Reset "proofing" and memory full error detection: it won't
crash your display list or BASIC program. MDRIVEXL can also tell
if you are using a cartridge (like the Assembler EDITOR), in
which case it won't try to store data in that memory space. I
think MDRIVEXL works on the 1200 XL, but I've never tried it.

When I first started using this device driver, I thought it
wouldn't be of much pratical value. As it turns out I use it all
the time and am still finding uses for it. For instance, it can
be used to move an entire graphics 9 screen from under the O.S.
to screen memory in about 2.5 seconds. With a slight modification
it can be used to store formatted Atariwriter files on disk. It
is much faster than using a disk to get rid of unwanted variables
by LISTing and ENTERing.

I have converted MDRIVEXL to a BASIC loader program that
generates an AUTORUN.SYS file. If you are interested in it, I
will be happy to send it.

I have a standard modem which I am using with my terminal presently, but I
would like to hook it up to my 800XL. I read about the serial to RS232 cable
but one person seemed to think there would exist some problems with such
a system. On the other hand, I have seen modems which hook up through the
joystick port. Has anyone put together a homebrew system in this manner,
or if they have any ideas about doing so, I would sure like to find out.

Thanks in advance for any advice,

Jerry Zarycky

FROM: gleaves (full name: Bob Gleaves)

     I desperately need help in debugging SCRIPTOR, a word processing program written for the ATARI and published in the april '83 issue of COMPUTE! I have a well-typed copy of it, with changes made for the XL computers (I have a 1200XL), as suggested in the version published in COMPUTE!'S THIRD BOOK OF ATARI. Does anyone have a working copy of SCRIPTOR? If so, did it work without changes?
     I need a clean copy of this so that I can experiment with a character set I have devised for use with Spanish language programs. If you can offer suggestions, please let me know. Also, I am interested in getting in contact with educators who are working on Spanish or French programs for use on the atari or on CP/M machines, such as my KAYPRO II.
     Thank you.

I gave in to my curiosity and bought Rana's Smartdos operating system.
Review in brief: A good, flexible DOS with some nice utilities thrown
in; BUT...if you have OSA+/DOSXL, Mydos, or Dosmaster, you probably don't
need Smartdos...especially for the price.

The DOS supports single or double density (not 1.5 density, even though
the RANA drive supports it). Smartdos is menu driven (with a pretty
large menu); commands are chosen by typing the first letter of the
menu item. The usual commands are there (copy, format, etc) as well
as some unusual ones, described below. Each command has subprompts,
and good use is made of color to help the user know where he/she's at.
The DOS has some useful shortcuts. For instance, the drive number (1-4)
alone specifies the disk; no "DX:" needed. Another example is the
single drive copy...the user can specify "=" to mean "copy all files
on a single drive".

One of the nicest features of the DOS is the ability to change drive
configurations on the fly. It supports up to 4 drives in any mix
of single or double density, and the "R" (reconfigure) command
toggles any of the drives between single and double without having
to reboot DOS or have a special double density version of DOS.
There is other flexability. A command called (get this!) "OBVERT
RESIDUP" allows the DUP part of the DOS to reside in memory; thus,
when flipping from BASIC to DOS and back, there is no need for
a MEM.SAV and no delay (OSA+ works this way). Smartdos may also
be reconfigured for fewer than 4 drives, and adjusted for the
max number of simultaneous open files allowable, thus freeing up
some memory if you don't need the maximum configuration.

There are some utility functions included in the DOS. There is
a disk speed checker, a sector copier (great...now I have 6
sector copiers!), and a disk checker (reads sectors and reports
errors). The disk checker is good...it even reports double
sectoring, but the manual does not talk at all about the kinds
of errors it can find.

The manual is OK, but not great. One frustrating error occurs
in the startup section, but most of the manual seems correct.
There is not much technical info (give me a memory map and entry

points, PLEEEEEESE), and sometimes the manual seems to wander and jump to seemingly unrelated information in the middle of a topic. It's better (and less cutesy) than their disk drive manual, at least.

The DOS is big (9.5K), but the user has the option of writing the DOS out without the DOS.SYS file. It's also expensive... about $50. In conclusion, if you don't have a double density DOS already, Smartdos is worth looking into. If you already have a DD Dos, it's probably not worth your while.

I have been having a tough time with my RANA 1000 disk drive. The drive gets a lot of CRC errors, especially when first powered up. After about a half hour, the situation improves; after about an hour, the drive performs fine. Do I have the only disk drive in the world that has to warm up? I have checked the disk speed when it is "cold", and it's OK. When I use it "cold", it takes forever to load a file, and some commercial programs, especially those that use double sectoring, don't load at all.

It wouldn't be so bad, except that this is the THIRD Rana drive I have had (it's only 2 months old, and got sent to me by the Rana service center after my second drive was returned with similar problems.). As far as I can tell, I don't abuse the drive...it just lives on my desk, away from the window and

TV, covered. Anybody have similar problems with their Rana
drives? Anybody with an Indus want to trade...?

Below is the index for the July 1984 issue of Antic magazine. There were a couple of interesting things contained in this issue. I'll comment on them in a seprate article.

July 1984 ANTIC Table of Contents

Page Article

10 BUILDING BODIES WITH COMPUTERS
A continuing story of how the US Women's Volleyball team is being helped by Atari computers.

14 LEARNING TO C
A look at the C language and in particular C/65 by OSS. Anyone know anything about this software? I don't find it listed anywhere.

16 CALL ME MODEM
A look at bulletin boards with a listing of some that are of particular interest to Atari owners.

21 EVERYBODY NEEDS AMODEM
This article contains version 4.2 of AMODEM, a public-domain terminal program.

25 ONLINE SERVICES
A look at several telephone accessable services such as THE SOURCE, etc.

31 ACTION!
This article discusses advanced programming techniques using the Action! language.

33 A VIRTUAL MIRACLE
A look at MicroTelecom's virtual modem prototype. They consider this to be a fourth generation modem.

36 PLATO RISING
This article discusses the Plato Services Network and in particular the cartridge that Atari will be selling in the fourth quarter that will allow Atari to be the first home computer to act as a terminal for PLATO. There is an interview with Vincent Wu, the designer of the software in the cartridge. I hope they have the cartridge at CES next week. I want to check it out.

45 ELECTRONIC NOTEBOOK
This article discusses the transfer of date between "notebook" computers and Atari personal computers. An 850 Interface is required.

49 THE SECRETS OF BASIC ANIMATION

The conclusion of a two-part article on Player/Missile animation through BASIC.

54 RUN,ROBOT,RUN

The fourth part of a series on articles that discuss experiments in practical robotics that can be performed with Atari computers.

60 TALK TO THE STARS

Discusses receiving Morse Code, Radioteletype (RTTY) and ASCII via shortwave radio and using a radio modem to read it via your computer.

66 SPACED OUT NUMBERS

Contains a RENUMBER program written by Jerry White and Fernando Herrera (of First Star fame) that allow you to renumber a BASIC program, including all references to line numbers in TRAP,GOTO,GOSUB, and RESTORE. I haven't typed it in yet, but looks like an excellent program if you don't already have one.

69 STARSECTOR DEFENSE

The game of the month is an arcade-style action game that requires BASIC and 16K RAM (Cassette) or 24K RAM (Disk).

81 CASSETTE LOOKALIKE--YOUR DISK DRIVE

This ML program allows you to make your disk drive work like a cassette to test cassette software.

88 PRODUCT REVIEWS

Software: Mickey in the Great Outdoors (Walt Disney Prod.)
Inter-Lisp/65 (Datasoft)
Lode Runner (Broderbund)
Ken Uston's Professional Blackjack (Screenplay)
Trains (Spinnaker)
Ultima I (Sierra On-Line)

Hardware: MPP-1000C MODEM (Microbits Peripheral Products)
RM1000 Radio Modem (Macrotronics, Inc.)
Volksmodem (Anchor Automation)

In summary, this is quite a good issue.

I noticed in net.micro.cpm that Conal.Elliott@CMU-CS-CAD.ARPA has the
Astra 1620 dual disk for the Atari. This unit looks interesting,
especially at the price ($469) Cosmic Computers offers; a double/single
density, two drive system for about the price of a single density,
single drive Atari 810 (old prices, I know, but still).

To the point of this note: I have not seen here or in the magazines
a review of the Astra disk system. Would someone on this net comment
on this system, is it a good disk system, worth the price or
worthless at any price?? ...

I bought a copy of OSS's DOS XL for use with their BASIC XL and ACTION!
cartridges; however, the version of DOS which resides partly in the
RAM which is overlaid by the cartridge ROM bombs. Since I am using
an Atari 400 with somebody's 48K RAM update, I am wondering if my
problem is not having a some signal at the cartridge connector.

Does anyone on the net know how OSS bank switches within their cartridge ROM
and what is required at the cartridge connector for their scheme to use the
RAM under the ROM to work?

For what it is worth, a short statement about OSS BASIC XL:

I am impressed with this cartridge. It is compatible with Atari's Basic;
it has renumbering, auto-line numbering, variable cross referencing,
block line delete, string arrays, player missle support, cleaner support
for joystick input, ... AND it executes faster than Atari Basic (I ran
Chicken and couldn't see some of the cars as they zipped across the
screen!!)

The February '84 "Consumer Reports" has a face-off for under $1000 home word processing systems. The players are Atari 600XL, TRS-80 CoCo 2, Commodore 64, and Coleco Adam.

Their preference is in that order. They also compare
cheap printers and the word processing software.

Anyone considering the purchase of peripherals for their Ataris
should read the article/review/plug (?) on a piece of gear called
ATR8000 on page 329 of the December '83 issue of BYTE. The vanilla
version of this thing is claimed to interface all sorts of devices
INCLUDING DISK DRIVES. The article uses the example of the Tandon
TM-100 for ~$200. In addition, there is a Centronics printer port
and an RS232 serial port. Unless you're going to load up your
system with gear, it's probably not worth the listed $348, BUT,
all other versions of the ATR8000 are stand-alone micros in addition
to Atari peripheral interfaces, either CP/M or MS/DOS, depending on
your pocketbook. This sounds really interesting. If anyone has
any additional info on the ATR8000 (not in the article), I'd like
to hear it and, I expect, so would others.

I've recently acquired an Atari 800XL for my family (me,spouse,5 yr old son).
I'd like to get a modem (possibly underwritten by my company) to talk to the
unix mini-computer at work. Eventually, I'd like to get a monitor and a printer
for my own use and the company's. At that point I could return the TI 745 of
the company's that I keep at home.
My question is: Does anyone have experience with trying to do what I suggest?
In particular, how does the 37 column limitation of the Atari work when the
mini expects an 80 column format?
Any and all help will be greatly appreciated. I don't want to buy until I know
what the capabilities and limitations are.

Thanks in advance,
Gregg W. Aughenbaugh

For sale: Naperville area

I have a used 10" Texas Instruments color composite monitor for sale.
I originally bought it because I needed better resolution than an
ordinary TV (it has 40 column resolution, but is better than ANY TV
I have seen for text, especially lower case text). I have been using
it successfully on an Atari system for over a year,but I am sure that
it will work with Commadores,and of course Texas Instruments 99/4's.
This monitor must be seen to be appreciated. I am selling it because
I now have an IBM system that requires 80 column resolution and RGB.

Price: $200.00

I have 4 different terminal programs. The one that I use the most often wiht
unix is The Terminal Emulator from APX. It allows you to use 80 column displays
by pressing shift and START. This causes all of the characters on the rightmost
side of a 80 column display to scroll onto the screen. It also includes the
ability to upload, download and dump the screen to a disk, cassette or printer.
Finally, it emulates an adm3a or vt100.

I have had some experience with logging into Unix from my Atari 800 from
home. The program I like the best of the 4 different one that I own is
The Terminal Emulator from APX. It allows you to use either 40 or 80
column display by mapping the characters into a scroll mode. By hitting the
shift and the START keys at the same time, when it is in 80 column mode,
you can scroll the right-most characters onto the screen.

The Deep Blue C "Compiler" uses a subset of the C language. Some of C's features are missing (like structures), but pointers & pointer arithmetic are there; enough of the language is there so that a C programmer will be happy.

Deep Blue C does not compile down to assembly language. It compiles into something that they call C-code, and when you execute a program it loads it into RAM with an assembly language interpreter of the C-code. Basically, this C-code is a psuedo-assembly language with a small "instruction set"; each instruction tells the interpreter to jump to a small section of real assembly code.

So its pretty fast, but not true assembly language. It lets you jump to a real assembly language subroutine to do things real fast. I wonder if it uses the Vertical Blank Interrupt for anything; if it does that means you can't steal that vector unless you find out what it needs and do it yourself.

To compile you have to run 2 programs, each of which needs to be loaded first, so it doesn't go real fast.

good luck.

I just got hold of a neat new cartridge for my 5200. It's CBS's Mountaing King (and it was only $20!!). I'm hoping that some of you folks out there have been playing with it for a while. There's a mysterious looking entity in the mines that has me convinced is a secret passage of some sort.

At the very bottom of the mines there is a little "house" into which the spider runs after an attack. Next to the house are the programmer's initials (always a good hint), and on top of the house is a blue horizontal line; the only other blue objects on the screen are ladders. I feel that this blue line may be the top rung of a ladder

which descends into who-knows-where. I've tried everything and cannot get anything to happen. (I am reminded of the trick reported here for jumping levels in the Miner 2049er game.)

If anyone knows of this game and/or secret ladder, drop me a line.

Has anyone out there discovered any software that doesn't boot or run properly on the new XL series? I have discovered that the following do not load in properly from disk:

Zaxxon (32K version)
Pool 1.5
Archon
Murder on the Zinderneuf
Worms
Pinball Construction Set
File Manager 800+

The 4 games Archon, Murder on the Zinderneuf, Worms, and Pinball Construction Set are all Electronic Arts games and they all fail the same way when attempting to load. Electronic Arts must try to access some illegal vector in the new OS in their boot sequence.

I have the following used atari equipment for sale

Atari 400 with Atari 410 cassette program recorder- great as a second computer
(membrane keyboards really are child-proff) or as an intro computer. Both for
$125.00

Atari 810 with happy modification, will back up any software that boots on an
atari without hassle or fuss, also much faster read times on ordinary software
great buy at $450.00

Wico trackball 35.00
Wico joystick 15.00

Atari 825 (centronics) printer with cable. $200.00

Todd Bradstrum IH-4f428

If you are using any disk drive besides the old Atari 810 then
the problem with booting your disks may not be the XL OS but
the disk drive. One software protection scheme times how long it
takes to load in sectors and will not boot correctly on new drives.

(Blue Max) will not boot using a 1050 disk drive.

ihuxf!bryan
Bryan DeLaney

P.S> Ah, the price for software protection (lost sales, incompatibly with
system upgrades). I refuse to buy software that is protected but will
buy unprotected software. The only exception is when the vendor gives
you two copies in case of disk failure.

Something which may help here is a "translator disk" that Atari is
offering for the XL series, which is nothing more than the 400/800
Revision A and B operating systems on disk. Using this disk is
(according to Atari) supposed to let you run old software which needs
a certain version of the OS. No, I haven't seen it anywhere or know
how much it costs, but I have seen it mentioned in both the "Atari Connection"
magazine and in the Jersey Atari Computer Group (JACG) newsletter.

According to "Antic", the translator disk is free of charge from Atari.
I guess Atari felt it was the least they could do.

Give Atari a call, I'm sure they will help you.

Few questions about Coleco game unit:

1. What is the CPU chip in Coleco? and What is the CPU chip in
   Atari?
2. I would like to know the memory map configuration of Coleco.
3. People told me that the Coleco cartridge interface has R/W, data and
   adress lines. Is this true, and what else is included in the
   interface?
4. What is the reason for Coleco to use a 32 K segment?
5. I also heard that the Coleco game software on ROM has to be
   loaded into the main unit RAM first in order to be executed.
   Is this statement true? If so, why?

Please send reply to me by mail. I will summarize if there is enough
interest.

I am considering upgrading my Atari 800 from the standard 48K RAM
to 128K. Has anyone had any experience in doing this?
If so, what manufacture did you use, and has it worked up to your
expectations?

If I get sufficient replies, I'll summarize to the net.

Thanks in advance

I just got the March issue of "Antic". There is an ad for the TRANSLATOR from Atari. It says that it makes the XL series of computers compatible with 'almost' all existing software. It is available in either disk or cassette format directly from Atari for $9.95.

cheers...

I am looking for someone who is using the Chameleon CRT Terminal Emulator program. Have you ever tried to customize the program by modifying the source files included on the disk ??? At least one file, TVBL, will not assemble for me. Any comments would be appreciated.

Does anyone have any information on the Indus GT drive for the Atari
Home Computers. Like is it really 4 times faster than an Atari drive,
and if so, how do they accomplish this feat? And what about the
software that comes with it (OS, word processor, etc.)? Are they at all
useful? All info appreciated. Mail replies to:

[]

I just got the latest newsletter from CompuClub. They carry or can get
any disk drive for the Atari computers. They were very impressed with
the Indus GT. They call it the slickest running, fastest loading drive
they have ever seen for the Atari (four times as fast as the 810). The
only thing faster is the Atari 810 equiped with the Happy 810 setup.

The Indus comes ready to run in single density, double density and density
and one half (to match the Atari 1050). It has worked with every piece
of software that they have tried (over 400) with no problems.

With the $120 worth of software that is included with the drive, they feel
that it is the best value on the market today for the Atari.

Their club price is $389. Has anyone seen a better price?

This is in response to Kit Kimes' question, "has anybody seen a better
price than $389 (for the Indus GT)?"

Yes, Gemini Electronics in Cedar Knolls, NJ sells them for $349. However,
I don't know if they handle mail-order or just run a retail store.

I have seen the Indus GT advertised at $375 by the sysop of a Chicago
area Bulletin Board. I think it was FDA, at (312) 335-1652, which is
what prompted my original query. So far I have heard nothing but praise
for this drive. It certainly sounds like a super deal so far.

I have just purchased one of the new Atari 800XL computers, and it is
sadly lacking in documentation. For one thing, I would like to know
what the pin-out is for the 5 pin monitor jack, to see if it is possible
to get a better picture by using one of the color monitors available.
(I have heard that the 1702 monitor marketed by Commodore is quite good.)

I have heard rumors, and seen pictures that indicate that the versions
of the games available for the 5200 and the 400/800 are not quite the same.
For example, it would seem that the version of Centipede for the 400/800
is slightly inferior to that of the 5200. I have not actually seen this
in person, so is there anyone out there who has, who would care to comment?
I thought that the 5200 was just a revamped 400, and thus should not do
any better than the 400. Is this just a case of old software (the 400 version
came out several years ago) not being as good as the new 5200 software?
Also, will the new 5200 games always be different from the 400/800 games?
(seems like a lot of duplication of effort).

Lines: 57

I was wondering if there were any new Atari games out on the market since
the last batch. I live in the cold wastelands to the north (Toronto, in
particular, and I see advertisements for games in the magazines which
are not available in any of the stores. The last batch of games to appear
here were Joust, Jungle Hunt, and Pole Position. I have seen advertised
Donkey Kong Jr., Pengo and Robotron:2084 as being available - has anyone
seen these games?
I am most interested in Robotron:2084, as this game was unbelievable in
the arcades, and I am waiting to see if the Atari can handle its
required speed.
<< minor flame coming >>
What really burns me up is Atarisoft coming up with Robotron and Stargate
for all of the other computers: Apple, C64, IBM, etc BEFORE bringing it
out for the Atari computers. I've heard the excuse that Atarisoft is a
different division, but I don't really care about these corporate excuses!
<<minor flame ends >>

In any case, here is the promised review.
I bought Joust a little while ago, and was initially disappointed by a
few things. Firstly, the resolution of the birds is nowhere near
the arcade version, and the birds are essentially monochrome (with a white
line through the middle representing a lance). It would have been nice if
the legs or the head of the bird were a different color.
Secondly, whenever there are more than 4 (or 5) birds in a horizontal row,
they begin to flicker. It would appear that they are using players to
display the birds (since collision detection is necessary/vital), and
whenever they need more players than are available, they time-slice the
display, and flicker occurs. This really isn't so bad, since it is a
relatively rare occurence, (at least at the lower levels), and only lasts
until you kill off some of the birds. One other problem is that the game
slows down when there are many (more than ~8 objects) on the screen. It
seems that detecting collisions among so many objects is quite time consuming.
I believe that this is why they did not include the little
men hatching out of the eggs, and having the birds swoop by and

pick them up (the men hatch riding on the birds already, and are temporarily vulnerable while sitting in a half-open shell).
Well, enough complaints and time for some praise. The rest of the game is excellently done: all of the arcade waves are there, the pterodactyl appears when you are slow and during the "pterry" wave, there are "egg" and "survival" waves, and the lava troll makes a grab for you occasionally.
Also, there are 4 levels of difficulty which are graduated nicely from novice - for people who have to learn how to fly, to expert - which starts off harder than the arcade version.
Also, (the credit goes to Williams for this) this is one of the only true 2-player games on the market (where 2 players play together on the same screen) where you are rewarded for co-operation, and well as for competition (during "team" and "gladiator" waves).
The rest of the graphics (the background rock) is very accurate, while the animation - birds flapping and being pulled down by gravity, and the eggs bouncing off the rock are very realistic and predictable by real-life experience. All in all, in spite of its deficiencies, an excellent game and one of my current favourites (love to play against my girlfriend) and I recommend it highly.

Has anyone tried using the four-color character editor program in Compute's Second book of Atari Graphics? It's written very cryptically and (at least on my 800XL) seems to have some kind of memory overlay problem. If anyone has gotten this program to work or knows if there are any differences between XL Basic and the old Basic, I would appreciate any help I can get.

.

Received from hogpc!houxn!rb Thu Mar 8 21:40:46 1984 :

The Indus GT is a very nice Atari drive. It comes with the following software:
1) DOS X/L (from OSS)
2) A generic Word Processor
3) A generic Spreadsheet
4) A generic Data Base
5) A "warp speed" utility

Items 1 and 2 above are currently shipped with the drives
Items 3-5 are "not yet available" and no ship date is being given
Indus merely says to return the warranty card, and they will ship the
missing software when available.

The drive runs in three density modes:
1) 810 mode -single density (40 trk-128 bytes/sector-18 sector/trk)
2) 1050 mode-"enhanced density" (40 trk-128 bytes/sector-26 sector/trk)
3) double density (40 trk-256 bytes/sector-18 sector/trk)

The drives appearance is excellent. A plexi-door seals it up for dust
free operation. A sensor starts the motor as a disk is inserted, for
proper centering. It gives all the appearance of being the best drive
for the Atari at the moment....(As an aside, a better way to go is
probably an ATR8000 which gives access to STANDARD drives---either
3" 5" or 8", available at MUCH lower cost....the combination price
of the ATR8000 and a standard drive is less than an Atari 850 and
just about ANY Atari drive!!!)

Retail price of the Indus is $450, includes the software above and
a suitcase type storage case which doubles as a disk holder after the
drive is unpacked. Discounts are seen down to $350.

Speed is still the same as the Atari 810/1050 until the new "warp"
software is available (when????)

If there is still anybody out there looking for memory for the Atari 400/800
(ie. 16k or 32k expansion boards) I have a fair supply of them that I would
like to get rid of (seeing as how I find dusty pc boards rather unattractive).

I will sell them for approximately $30 for 16k and $50 for 32k (or a realistic
offer).

My mother is a principal at an elementary school and is currently considering buying some atari computers for educational use. However she has heard, as I have, that Atari is getting out of the personal computer business. Is this true? If not, then how is the Atari as an educational tool and which model offers the best educational software, if any, for elementary school children. Please include any information that you think is relevent in your reply. Please reply by mail and as soon as possible as she is facing a deadline. Thanks in advance.

<munch>

Sorry for repeating an article, but I am new to the net, and that last article must have looked pretty bizarre (disgusting?). Anyway, here goes again...

I have a bunch of atari 400/800 memory borads, both 16k and 32k that are gathering a lot of dust and would look better if turned into a familiar paper substance (the kind that I keep trying to find in my wallet).

If anyone still is thinking of buying these dinosaurs, I am selling them for a reasonable offer ($30 to $50 for 16k or 32k).

I am tearing my hair out! When trying to run my modem at 1200 baud, I start to lose characters every so often, very predictably and non-noise-related. I have written a terminal emulator in action, which works fine, except for this bug. It always follows an EOL character being Put() to the screen. The first character after the EOL keeps getting lost somewhere, and gets chopped off on the screen. It is not in the buffer, since the buffer never gets more than two characters in it before I read them out. No overflow there, at least. It has nothing to do with the host, since even my modem echoing commands to me exhibits the same property. It starts out fine, then after

about 20 lines it starts to act up. Almost like bits are being lost somewhere.
The thing is, when I hit system reset, it goes back to normal again. That is,
the cycle starts over one more time. This doesn't happen at all at 300 baud,
and the crazy thing is, that if I put ANY CHARACTER besides EOL in the same
spot (like a slash, for experimentation's sake), then no bytes get lost. Of
course, all the output is on the same line, too, so it isn't ideal. I've
even tried to simulate EOL by messing around with ROWCRS and COLCRS, but then
I have to scroll, and for some reason after I scroll it up I can't use the
ROWCRS any more, or it's out of range or something.

ANY IDEAS? I can clarify specific details if you think you have some idea
what is going on.   JACK PALEVICH--I have been looking carefully at your
Kermit program--you do things pretty much the same--have you encountered this
strange behavior????   H E L P !!!

A few months ago I bought the ATARI Communicator II
package for my ATARI 1200XL. The catalogs I had
been reading spec'ed the 835 modem as 300/1200 baud.
Only after hooking it up did I discover that it works
at 1200 baud only if connect an additional 1200 baud
modem to it!!!

Other 300 baud modems for ATARI connect to the 850 interface,
the 835, however, connects to the ATARI peripheral daisy
chain. The TELE-LINK II software prevents operation of DOS,
so one can't use it to upload or download files to or from
disc!!!!!

HELP!!!

Does anyone out there in net-land know of software that
works with the 835? Hopefully it would run under DOS
and be in a source code form so it could be 'hacked' to
taste. Alternatively, does anyone know the internals
necessary to create an IO control block for the 835?

Does anyone have any more information on the ATR8000 ?
I'm trying to find out where they are available and
what their real selling price is. Any help ??

     As some may have heard, CBS Electronics is getting out of the game software business. They say that they are going to concentrate on educational software. They originally released six cartridges for the Atari Computers. They were:

          K-razy Shoot-out
          K-star Patrol
          K-razy Antiks
          K-razy Kritters
          Mountain King
          Boulders & Bombs

I have seem all six of these games on the bargin table of some of the local toy stores. I picked up Mountain King for $9.88. The other one I read a good review on was K-razy Antiks. I might go back and get that also. If you are in the market for some bargin cartridges, you might check out your local store that carries close out cartridges.

I have a young friend who seems to be well on his way to becoming
a first rate programmer. He has been offering this service for
a couple of months now to members of his local (Eugene, OR) Atari
Users Group, and I thought You-Out-There might be interested.

Here goes:

From: Tim Ebling
To: All Atari Users
Subject: Magazine Disk

   If you've ever tried to type out a program listed in a
magazine, you know just how many hours are required to
type a program that usually is filled with bugs.
   Now there's a better way: The Magazine Disk. It contains
all the listed programs from the month's top three
Atari magazines, Compute!, Antic, and ANALOG. All the
programs are in a neat, menu-driven format, and completely
error-free [Note: I assume he means no typing mistakes].
This disk is double-sided and both sides are filled to the limit.

To Order, send $5.00 (or $3.00 if you send a blank disk) to:

              Tim Ebling
              1501 River Loop #1
              Eugene, OR
              97404
              (503) 688-6872

I don't own an Atari anything, so I haven't ever tried one of his disks.
However, I can vouch for him. I thought someone might find this
useful/interesting/worthwhile.

From the Rainforest,

     I don't want to rain on this guy's parade, but there are copyright laws which prohibit this practice. Analog recently had a survey of its reader on the subject of piracy, and they said that you must buy the magazine if you are going to get a copy of any program in it from a friend. I know the rules are somewhat blurred on this point, but I don't think it's worth a possible law-suit. If this guy keeps a low profile, he might be safe, but if he makes any money at it, the lawyers will be at his door.

NOTE: Buyers (and sellers) beware!

A couple of months we got a similar offer from a company calling itself U.S. Computype out of Bountiful, Utah. They wanted to charge $90 a year or $12 a month for essentially the same thing. I sent a check for one month to see if it was for real. You had to sign a statement that you actually owned the issues you were going to get on disk (I assume this was an attempt to get around legal problems since it is legal for someone else to do the typing as long a you own the magazine

according to Compute! magazine).

Anyway, a couple of weeks later, I got a letter with my check back saying that they were having problems and would let me know as soon as they could take orders. I can only assume one of the magazines brought some kind of suit against them. I haven't heard from them again as yet.

Moral: It may be possible to get away with this sort of thing on a local level but if this person tries to go national (and even international over netnews) he could be in for some legal problems.

This is a friend of dsaker.

Greetings from Australia, fellow Atari users. Yes, the Atari has a strong following Down Under. I am a member of ACTARI, the users group based in Canberra (the capital, for those that don't know).

Archon II???? Tell me more!
Where can I get Excalibur by Chris Crawford? I've tried half a dozen stores for it.
Is it true Atari sacked Chris Crawford? For those interested McGraw-Hill have recently published a book by him called (I think) "The Art of Computer Game Design". If you like his work you'll like this book.

You may have guessed that getting software for the Atari can be a problem so far from the source, so while I am here (on holiday) I'm getting as much as I can.
My favourite arcade game of the hour is "Discs of Tron".Is there an Atari version?
Please send replies via dsaker.

I wandered into a Best Products catalog store here in Cleveland this weekend to find many Atari label products on sale! I managed to snarf up some software items that I needed, but there were some other significant cuts. The catalog prices for 600XL and 800XL machines are now approximately $100 and $170, respectively! This makes the 800XL quite competitive with the C64 (needless to say.) The software sale items were quite obviously losers to be dumped from Atari (or Best) inventory (such as Conversational French.)

Anyway, it looks like the price cuts are on and if you have a Best store in your area, it may be worth a visit. (I don't know if this sale is local or a national thing.)

October 1984 (# 23) ANALOG Table of Contents
(Theme ????)

Page Article

15 A NO-FRILLS ALTERNATE CURSOR
Short BASIC/ML program to give you a bliking underline cursor, instead of the normal block cursor. Has some limits, such as that it occupies page 6.

25 CLIMBER
BASIC game (16K/24K cassette/disk). Climb a "building" and jump over "munchkins".

29 MINI COMP
A BASIC program to COMPILE (yes, COMPILE) a subset of BASIC to ML. Accepts assignment, addition/subtraction, if-then, <, =, gosub, return, peek and poke statements. Needs 40K disk.

33 P/M CREATOR/ANIMATOR
Very flexible Player-Missile editor in BASIC (16K/24K). Also allows you to create players for animation and view them in succession.

39 FIRE BUG
Another Hudson/Peacock ML game (from BASIC program. Firebug has to tunnel underground to avoid a variety of atomically mutated baddies. Supposed to have great action, scrolling, sound and graphics. 16K/24K.

56 ANOTHER BASIC BUG
Yet another bug in ATARI BASIC. Seems that the VAL function and GET statement together in a program can cause unwanted alterations in character strings.

57 GRAPHICS 8 CHARACTER GENERATOR
BASIC subroutines (with assembly listings) that allow you to generate characters (Atari built-in or your own) on a graphics 8 screen. This lets you do things like mix graphics and text, print at angles, double space, print backwards, etc.

65 DARK HORSE
BASIC simulation of a presidential election campaign. 16K/24K.

HARDWARE REVIEWS: Casadapter (SAR-AN) - "A grade of 9 on a scale of 1-10 IF the manual were VASTLY improved."
ATR-8000 (Southwest Microcomputer Products) - "A truly innovative product"

SOFTWARE REVIEWS: Family Finances (Atari) - "A real value"

Top-Dos (Eclipse Software) - "GREAT"
Donkey Kong Jr. (Atari) - "Good Fun"
BOOK REVIEWS: Dr. C. Wacko's Miracle Guide to Designing and
Programming your own Atari Computer Arcade Games -
"Good, Introductory reference
Book"
PLUS: Editorial, Reader Comments, "Griffin's Lair", "Boot Camp",
New Products columns.

NOTE: "Ask Mr. Forth" is a new column that replaces
"Ask Sally Forth".
NOTE: "BASIC Training" column kinda sorta takes over
where the "Our Games" column left off, in that
that they will develop a BASIC game...however,
readers will NOT design the game.

[I'm so sorry, he's from Barcelona.]

Here is a nifty little bit of assembly code I wrote to shut off the keyclick on my Atari 800 so my roommate could sleep whilst I stayed up all night hacking. It hasn't been thoroughly tested but works fine with my Chameleon terminal emulator and with the basic cart. The only problem I've found is that it won't coexist with DUP (but what does?), apparently DUP overwrites part of it and it crashes the system on the first CR. If you are using Atari's DOS set it up as an AUTORUN.SYS and boot with the basic cart in. If you need to go to DUP, hit the SYSTEM RESET first, that will reset every thing back to normal (and

bring back the keyclick). If using OS/A+, with the Basic cart
you will have to go to dos (DOS), load this, then go back to Basic (CAR),
without the cart just load it from the D1: prompt.
   I have a standard Atari 800 (pre-XL vintage) with one Atari 810 drive,
this is the only configuration this code has been tested on, so if you
have something else you'll just have to give it a shot and see what happens.
This code should work on either Rev. A or B of the OS roms, I copied
the code from the Rev. A OS list and it works on my Rev. B. I'm not
familiar with the XL roms but I believe they have an option for turning
keyclick on/off, so this isn't for them anyway. It should also work on
the early 400s but I can't remember if they had a console speaker or not.
   I'm turning this loose to the world at large with the condition that
my name remain on the source code. Please send any praise/suggestions/
bug reports to me (hitchens@ut-sally.{UUCP,ARPA,etc}) This code is
written for OSS's MAC/65, but can easily be converted to just about
any Atari assembler.

Bonadah,

 Ron Hitchens   hitchens@ut-sally

0150 ;
0160 ;Relocates to MEMLO, doesn't take any page 6 or any other fixed space.
0170 ;This code will turn off the keyclick produced by accesses to the
0180 ;E: or K: devices.  But not the snarfing bell thru the console speaker.
0190 ;It does this by changing the pointers in the handler tables for the
0200 ;K: and E: devices to point to new code which is a copy of the ROM
0210 ;code without the calls to the keyclick routine.  This code follows
0220 ;the protocol for installing device handlers, except that it doesn't
0230 ;hook itself into the reset chain.  This means it will not survive
0240 ;a SYSTEM RESET, but it may be loaded again with no problem.
0250 ;Loading it again (once it is already installed) will not hurt
0260 ;anything, it just loads another copy above the current one,
0270 ;wasting a little space.
0280 ;The action of this handler should be transparent to all applications
0290 ;providing they do legal accesses to the keyboard.
0300 ;Written for MAC/65, should be compatible with assm/edit cart
0310 ;excepting maybe .OPT and .IF statements.  .IF can be removed.

October, 1984 ANTIC magazine TOC
Theme: Computer Learning Magic

page article

12 INSIDE ATARI
A review of the new Atarilab educational series.

15 COMMUNICATIONS -- PLATO TEACHES
A discussion of what PLATO is and what it offers in terms of education.

17 COMMUNICATIONS -- PLATO'S TOP CLASSES: A SAMPLE
A review of 'Zeiss Planetarium, one of Plato's more popular learning program.

19 LOGO -- SOLVING PUZZLES WITH LOGO
Short puzzle solving routines in Logo that demonstrate the language's logical analysis power. (requires LOGO)

22 MOLE ATTACK (Educational Program)
A way for young beginning typists to practice finding letters while having fun.

23 PLUS MINUS (Educational Program)
A simple arithmetic program for young children.

26 BRAIN RESEARCH WITH THE ATARI
An article showing the powerful use of the Atari.

29 EDUCATIONAL SOFTWARE
Antic's top picks in the following fields: Early Learning, Early Math, Logic, Language Skills and Construction & Strategy Games.

35 ATARI AT A SCIENCE MUSEUM
A look at how Atari's are used in University of California, Berkeley's Lawrence Hall of Science workshops.

39 PROGRAM THE BOUNCING BALL
A player/missile graphics tutorial, an excerpt from the book 'Computer Animation Primer by David Fox and Mitchell

Waite.
42 ANTIC 4/5 EDITOR ANIMATOR
This article lets you design and produce smooth animation sequences in four colors with blocks of characters in Antic Modes 4 and 5 (Graphics 12 and 13 on XL computers).
45 JACKS (Game of the Month)
A short elegant program for the classics kids' game.
47 DIVER (BONUS GAME)
This arcade-style BASIC action game has you as the commander of a small one man diving bell. You explore dangerous reefs in search of treasure chests.
51 SOFTWARE LIBRARY
The center of the magazine now contains all the program listings from the magazine. They are designed to be cut out and filed in a loose leaf notebook. This allows you to lay them flat while you are typing and makes it easier to store them.
72 RATING COMPUTER SAT PREPARATION COURSES
A look at the courses from Harcourt Brace Jovanovich, Program Design, Inc and Krell Software Corp.
74 SPRAY PAINTER
A short but powerful subroutine that you can add to your favorite Graphics 8 paint program. This feature is a favorite of MACINTOSH owners.
76 PRODUCT REVIEWS
Software:
Chatterbee (Tronix)--Must have S.A.M. to work.
Delta Drawing (Spinnaker)--Turtle graphics
Little Red Riding Hood (Futurehouse, Inc.)--Must have S.A.M.
Reading Comprehension Skills & Learn About Words (American Educational Computers)
Speedread+ (Inet Corp.)
Memorease+ (Inet Corp.)
Books:
Buy a School for your Home (Reston Publishing)
The Art of Computer Game Design: Reflections of a Master Game Designer (Osborne/McGraw-Hill)--by Christopher Crawford, former head of Atari's Game Research Group, programmer of 'Eastern Front 1941' and 'Excalibur'.

Comments

ANTIC claims that they are the #1 Atari Computer Magazine. I don't know by what standard, but I do know that they are improving every issue, and they are really trying to serve the Atari community. They have been changing the magazine for the better and now all the program listings are in the middle of the magazine by themselves so they can be removed without disturbing any articles. ANTIC has an active notefile on the PLATO system. They are investigating ways to start a special bulletin board for users groups that would organize regular nationwide users group teleconferences, provide a super-accurate product rating system based on feedback from all over the nation and generally provide a clearinghouse for national users groups. They are starting a direct mail catalog of products (software and

hardware) because it is so hard for small companies to get nationwide distribution. All ANTIC subscribers will automatically receive this catalog and anyone else can write and ask to be put on the list. They are hoping to carry all the dropped APX software and the software of any third party vendors that want them to. Their Public Domain Software library is expanding. They have added 8 new disks this month including a double sided disk containing Antic FORTH, a Business disk, a Computer tutorial and a Telecommunications disk including a new improved version of AMODEM. Disks are still $10 each plus shipping. All in all, a very good issue.

[.....]

Greetings, Atarians!

Can someone tell me what the Indus GT "syncromesh data transfer" is?
I bought an Indus, and got the three freebies, but no info on this.
What does it do, and when is it supposed to be available? Is it
included with the drive, or something one must purchase?

Thanks!

--Bob Mitchell

[munch, munch, munch]

In reading through my borrowed copy of Antic, I encountered what looks to
be a fairly decent disk drive by INDUS industries. I was wondering if
anyone else has one or has any comments on the INDUS GT and, perhaps more
importantly, if anyone has any ideas as to where to find one. Any comments
or pointers would be appreciated. Preferably send them to me via one of
the paths listed below.

[Debugger]

I have just purchased an Atari 600 XL (new) for $90, and see it has

a connector labelled "parallel bus" on the rear.

Does anyone know what's available there? How about pointers to this
info?

Thanks,

>company. anyone know how to do this???

If you start to play the game, and put the
miner in the middle of the first screen, you can type the phone number
that's on the title screen followed by the number of the level you
want to start from, and you get there. It's been a while since I've
done this, and I'm recounting purely from memory, but I have seen it work.

I am having trouble with modifying the display list to mix graphics and text modes. Specifically, I have written a slot machine game using the PM Animator software. I poked memory locations used by the display control chip to put some graphics mode 2 lines in a graphics mode 7 field. The program works fine on my 800 using a monitor for display. If I use a normal TV the display rolls vertically. Question; Am I sending too many lines to the display chip? Is there a memory location to control the number of scan lines sent to the display?I believe the monitor just ignores the extra lines.

<>
The display list itself determines how many scan lines are to be generated.
Thus if you modify the display list, you need to redetermine how many
scan lines are defined and make adjustments in the list to keep that number
to about 216. "Your ATARI Computer" by Ion Poole has a lot of information
about customizing the display list.

I recently read in Popular Mechanics about a product called Mind Link it is
appearently
a device that can detect the movement of the users eyes and thus operates a video
game.
I have a friend who works with the handicapped and could make use of such
technology. Any information would be ampreciated.

November 1984 ANALOG Table of Contents

Page Article

17 ATARICON REPORT
    Report on the Atari User's convention held in Southfield, MI this past August.
33 BOPOTRON!
    BASIC (16/24K) climbing game
39 CIRCUIT DATABASE
    32K disk BASIC program that allows you to design store and recall electronic schematics. Input for various electronic symbols are done with a single keystroke!
51 XL-DOS
    Atari DOS 2.0S modification that allows DUP.SYS to reside in the unused top 16K of memory (on XL machines ONLY). Ends loading time to get to the DOS menu, and MEM.SAV is no longer needed.
55 CASSETTE COMPRESSOR
    BASIC (16K) program that takes any tape file that will fit in core and writes it out using short interrecord gaps. Speeds up tape loads considerably.
58 BOFFO
    16K BASIC program that converts object code into BASIC data statements
63 BOPOTRON CONSTRUCTION SET
    16K BASIC program to allow you to create your own BOPOTRON screens (see above).
72 RACE IN SPACE
    16K/24K ML game. You and an opponent pilot a spaceship through asteroid fields.
90 UNICHECK
    A "universal" checksum program that, like C:CHECK and D:CHECK, is used to find typing errors. This differs in that it is loaded from an autorun.sys file and is core resident...the checksum program can be called anytime without disk usage.

[Insert favorite line-eater here]

I am in the market for a 1200 baud modem to be used with an Atari 800
and an 850 interface unit. I would appreciate any information on the
Hayes 1200 Smartmodem, Signalman Mark 12, the Promethius (sp?), and
any other brand that has a good reputation.

Please mail responses, and thanks in advance!

Does anyone remember seeing a review of SubLogic's Flight Simulator II
for the Atari? I've fiddled with the IBM PC version from Microsoft.
How does it compare? Owners responses are welcome.

Fellow Atarist:

After acquiring the August 83 backissue of ANTIC magazine, and
spending many hours typing in KEYSTROKE ARTIST, I find out that the
assembly language routine in string format is messed up.

Does anyone have a working copy of this program? It's public
domain stuff and I've paid my dues so if anyone is willing to recover my

many hours of typing and supply a working copy it would be greatly appreciated.

2) While on the subject of old programs, does anyone have the following programs in exchange for whatever I have:

RAGS to RICHES ANTIC June 83
STARGAZING ANTIC June 83
3-D FUJI ANTIC August 83
AIR RAID 2000 ANTIC November 83

3) Anyone hook up a DF03 to the ATARI 850 ?
How do I get it to auto-dial ??

Dennis

I friend of mine has written a game called GAUNTLET and is making it available as user supported software. This means it isn't available in stores. You can get it from anyone who has it (no protection!), from BBS, etc.

GAUNTLET is a 28K assembly language program that runs in a 32K Atari with disk. You are the pilot of a lone spacecraft trying to penetrate the defenses of an enemy battlegroup dug in on a small moon. There are 50 different screens, 17 different kinds of enemy ships, and 10 different types of enemy weapons. The enemy ships are intelligent and dodge your shells and shoot your shells out of the sky. There are camouflaged gunbases that are almost invisible. There are enemy ships that drop robot ships that fight on their own. Mines will chase you. Enemy scouts and hunters use the terrain to trap and kill you. Most enemy ships fire more than one type of weapon.

Your ship is equipped with rapid fire fusion bolts and a special weapon that you choose from homing missiles that burn through rock and TRIDEX that explode along a plane.

There are three skill levels and two modes. The action is VERY fast and will challenge your gaming skills.

I don't have a sector copier and thus can't share my copy, but if you send a donation of at least $5.00 to the author, he will send it to you (he provides the disk). It is worth much more than $5.00, and I recommend it!!

The author's address is Donald R. Lebeau, P.O. Box 376, Pepperell, MA 01463.

I have rented the flight simulator II for the atari; It is a magnificently done program, no doubt about it. It has most of the features of the IBM Microsoft version (there are some minor features that are only loaded in if you have 64K, ie, an XL machine). Of course, the screen update is slower...about 3 frames per second, compared with the IBM's 16 frames per second; however, I found the speed perfectly adequate. The controls are responsive and the "dashboard" seems to get updated even faster than the scenery.

The program comes on two disks, one with the main program and two "scenery areas", Chicago and the WWI pilot scenario. The other disk comes with four additional scenery areas. All parameters are user modifiable (weather, reliability, etc). The documentation is excellent...one large book describing the

program itself and the plane's operation, the other book about flight physics and acrobatics. In addition, pilot's maps of the program's geographical areas are included.

My opinion of the program? Again, it is a masterpiece of programming. The detail is unsurpassed. Most of the plane's controls are from the keyboard, however, and I found they were not easy to learn. Also, sometimes the details were a bit too detailed. For instance, should I really have to worry about kicking in the magnetos for each engine? In fairness, there is an "easy" mode where many details are automatically taken care of. However, you can't get some details without including all of them.

Basically, I feel that the program is SO realistic that it was too much work to be much fun. You get the work of flying without the exhilaration. However, as a true simulator, it is among the best for micros, and it is certainly worth having as a collector's piece (if you feel like shelling out the money...I didn't think it was worth it).

           OKIMATE-10 Color Printer from Okidata, Inc.
           -------------------------------------------

Manufacturer: Okidata, Inc., Mt. Laurel, NJ

Dealer: BEST Products Inc. (Discount Showroom Distributer)

Price: Approximately $210 plus tax including Commodore (or Atari) interface,
       black ribbon, color ribbon, cable, manual, diskette, cassette, and
       a small amount of paper. (on sale for $20 off that price at store)

Print technique: 8-dot matrix thermal head with heat transfer of ink from a
          film-type ribbon to ordinary paper.  Will also print on
          thermal paper without a ribbon.

Paper: Up to 8.5 inch single sheet or 9.5 inch sprocket feed

Ribbon: Special cassette for OKIMATE-10, Black ~$6.00, Color ~$6.50
        Black ribbon good for ~120000 characters (25-75 pages)
     Color ribbon good for ~30000 color characters or 10 graphic screens

Fonts: 5 Fonts selectable via control characters -

     Normal          10CPI,  80 Char/Line, with descenders
     Wide             5CPI,  40 Char/Line, with descenders
     Fine          17.1CPI, 136 Char/Line, with descenders
     Bold           8.5CPI,  68 Char/Line, with descenders
     Reverse Normal  10CPI,  80 Char/Line, no descenders

Case: Supports either Upper case/Graphics or Lower case/Upper case

Graphics Capability: Commodore 1525 compatible

Speed: 60 Characters per second (text), ~3 inches per second (graphics)
```

Interface: Commodore serial bus, device #4 (jumper selectable as device #5)

Color Capability: Color ribbon with sequential carriage-width blocks of three
transparent additive colors. Photocell synchronization to
beginning of first color block. About 50 colors can be
achieved for graphics via overlay and interleave.

Software: 2 Programs on disk and tape:

Learn to print - a tutorial on using the printer

Color screen print - a utility package which reads color
graphics screens from disk, and prints
them using the color ribbon.

Control Codes:

^O	Reset to normal font, non-graphic mode (default)
^N	Wide font select
^]	Fine font select
^]^N	Bold font select
^R	Reverse font select
^R+128	Reverse off
^Q	Lower case/Upper case select (default if secondary address=7)
^Q+128	Upper case/Graphics select (default if secondary address=0)
^J	Line feed
^L	Form feed (11 inches from power up position)
^M	Carriage return (with optional, jumper selected, line-feed)
^Pcc	Tab to column cc (2 decimal digits characters)
^[^Jx	Fine vertical spacing for next line is ASC(x)/144 inches
^[^Pxy	Fine horiz. position ASC(x)*256+ASC(y)/60 inches
^[B	Disable 1 inch perforation skip at bottom of page
^[A	Enable 1 inch perforation skip at bottom of page (default)
^H	Enter graphics mode (follow with 7 dot high graphics like 1525)
^Zxy	Repeat graphics mode (repeats ASC(y), ASC(x) times)
^[^Y	Align color ribbon to beginning of yellow/magenta/cyan set (next 3 lines printed will print on top of each other)

Quality:

Well, here's the bottom line. I didn't keep the printer. While it appears to be mechanically well constructed, the print quality for normal black on white printing was pretty terrible. At the darkest density setting (the manual recommends using a medium setting), the characters were just barely dark enough to tolerate (and then only on the absolutely smoothest of paper); unfortunately the problem is more than darkness, it is consistency. The character appearance is extremely variable, with different letters on the same line and different parts of the same letter (both vertically and horizontally) of different darkness, somewhat at random. Since it could have been the ribbon, I tried thermal paper without ribbon. The result was the same, except the print was much lighter (totally unacceptable) in addition to being inconsistent. To rule out a defective print mechanism or head, I tried a second sample and found it was essentially the same, although slightly worse on thermal paper.

Incidentally, the examples printed in the manual, and the picture inside the cover of the box show very acceptable black printing, but I suspect they are doctored. Not being one to give up easily, I took my second sample to Okidata field service in Mt. Laurel, NJ. The manager there took a look at the print and said "oh, yes, that is much too light - I'll have an engineer check out a new one for you." He brings me out a box with a new printer and a piece of paper which looks semi-reasonable and says that that printer printed this piece of paper with the light-dark control at mid position. So I leave, get home, plug it in, and detect no substantial improvement - I couldn't even get it to print as good as the sample on the *same* piece of paper with the control set to *dark*, even after trying a new ribbon (they gave me a free box of ribbons!).

Interestingly enough, if you are careful to use the smoothest paper, the color plotting mode is quite nice; the head moves much slower than in text mode and seems to be able to more evenly melt the ink onto the paper. The accompaning screen dump software worked very well, but did have some incorrect color renditions (for example, the C-64 has 3 shades of blue - the lightest shade of blue produced by the screen dump program was actually the medium blue of the C-64 set; many of the grey shades were too dark and acutally dark blue).
Also, the vertical positioning mechanism, while quite accurate, could not quite avoid gaps or overlaps between the 7 dot high horizontal graphic fields; this somewhat (but not completely) detracted from the beauty of the final image.
Black and white graphics seems to work ok too - I tried printing music from the Music Construction Set with reasonably decent results, although not all the ink seemed to stick to the paper.

This printer is quite rare now, but should be showing up in computer stores within a few months. You should definitely see one demonstrated (bring some of your own paper too) before you buy. It may be that these problems are just the woes of the early production run and that by serial #20000 or so, things will improve. Then again, perhaps that's all you can get from that price technology, but if I'm going to spend 10 cents a page for a film ribbon, I'd like to get film ribbon quality out of it. Ultimately the consumer will decide if this is going to be an Okiflop or an Okisuccess.

In order to make a custom display list work best on a normal TV,
you should have no more than 192 scan lines in total. If you have
more than that, rolling may occur on a TV because of the overscan.
I can not recall how many scan lines each line of graphics takes,
but I think each line of gr.7 is 2 scan lines, and each line of
gr.0 is 8 scan lines.
Another problem that could cause the rolling on the TV is that
if the screen data crosses a 4 K boundry, weird things happen.

Sounds like a chain letter to me!

If it's really that good, why not submit it to ANTIC or ANALOG, and
REALLY put it in the public domain, while at the same time getting PAID
for it?

After living with the same expectations, I guess I'll repost the answer....
There is no TERMCAP for a COMPUTER, only a TERMINAL!!

Since there are several terminal emulators for the ATARI 800 out there, pick one and use the TERMCAP as appropriate. Several good ones include ADM-3A (by SWP) and CHAMELEON (by APEX). In addition, CHAMELEON allows you to customize and roll your own.....The ADM-3A emulator with the SWP ATR-8000 can run in either 40 or 80 column (with monitor) and no additional hardware.

I have an Atari 810 Disk Drive that needed had its motor replaced. It now refuses to read any disk. I believe it has either a speed problem (possibly a loose belt?) and/or an alignment problem. The local service center is asking $55 plus parts to fix and $25 if I just want an estimate of what is needed to repair it. Anyone know of a cheaper place, can do it themselves, can give me instructions, etc.?

I will send the results of the responses to anyone who wishes.

Thanks in advance,

Len Hayward

There have been a couple of articles lately about TERMCAP entries for the ATARI. As Rob Bowtin stated, the TERMCAP entry is for a particular terminal, or in the case of an ATARI, for a particular terminal emulator program. The program I use most often is the 80-col terminal emulator for the ATR8000. (If you don't have an ATR8000, this is NOT APPLICABLE.) This program is supposed to emulate an ADM 3A, but there are some differences. The TERMCAP entry below works better than the standard 3a entry. I have also written an entry for the 40-col program, which actually has more features than the 80-col version (e.g., line and char insert and delete). It is also given below, but I think it may still have some bugs (with the standout mode???) -- I'm not sure, since I seldom use it.

The ATARI parallel bus pin-out.

This information is from the 600XL Field Service Manual.

GND	1	2	EXTERNAL SELECT
A0	3	4	A1
A2	5	6	A3
A4	7	8	A5
A6	9	10	GND
A7	11	12	A8
A9	13	14	A10
A11	15	16	A12
A13	17	18	A14
GND	19	20	A15
D0	21	22	D1
D2	23	24	D3
D4	25	26	D5
D6	27	28	D7
GND	29	30	GND
PHASE 2 CLOCK OUTPUT	31	32	GND
N/C	33	34	RESET OUTPUT
IRQ	35	36	READY INPUT
N/C	37	38	EXTERNAL DECODER OUTPUT
N/C	39	40	REFRESH OUTPUT
COLUMN ADDRESS OUTPUT	41	42	GND
MATH PACK DISABLE INPUT	43	44	ROW ADDRESS STROBE OUTPUT
GND	45	46	LATCHER READ/WRITE OUTPUT
N/C	47	48	N/C
AUDIO IN	49	50	GND

To locate pin 1,

while looking at the back of the unit, pin 1 is on the top right side.

This is the only information I have.
NO!! I don't know anymore about the use of the pins.
NO! I don't know if the pinout is the EXACT same on the 800XL.

This is the only page of the Field Service Manual I have. I recieved it
from Atari on special request.

Does anybody know any more about the bus??

I will post a summary of any replies I get.

Ted O. Burger

Those prices are VERY reasonable for what you ask. Point of fact, the
ENTIRE innards can be replaced for about $250 using components available
through surplus outlets when ATARI stopped making the 810.

The repair fees are more for the TIME he must spend on your drive.
Speed is easily maintained by adjusting the speed pot. on the power supply
(rear) board. Alignment is often so time consuming that the entire
mechanism is usually replaced as an expedient.

Depending upon the age of the drive, you might want to replace other parts
as well, for example update of ROMs, and data separator board. Also, there
are closeouts available on the new 1050 disk drive in the $250 price range
(yes, these are NEW!)

So all in all, if they're gonna fix it right for 50 bucks or so, they're
not rippin' ya off!!!

There is no 5 volt output on the Atari bus.

Also if you hold the computer with the back facing you then pin 1 is on
the top LEFT side. PIN 1 IS NOT ON THE TOP RIGHT SIDE IF THE
COMPUTERS BACK IS TOWARD YOU !!!!!!!!!

YES This bus is the same on the 800XL

   I just bough an 800XL for my daughter and now need a disk drive.
Does anybody have any recomendations?
I'd like all the capacity I can get, of course.
Does anyone make a disk system which uses the expansion bus?
A previous article refered to "closeout" prices on the 1050 drive;
is it being replaced by a new model??

I recommend the INDUS G.T. Several friends of mine have them and
they come HIGHLY RECOMMENDED. I know only one person who has a RANA
and when I was over at his house, it started acting strange. He says
he's never had any problems until then though. (acting strange means=
Lots of disk errors in this case). I use and ATR-8000 with an NEC
half height double-sided double density (IBM compat.) drive in addition to my
original Atari 810. By the way the ATR-8000 supports up to 4 drives
and I also have 2 8" Sugarts (sp?) that I periodically hook up
(when I'm not using them with my old standby- an IMSAI)

The low end (non-CP/M) ATR-8000 is priced right around $300, and
you shouldn't have to pay more than about $170 for a disk drive
(that's how much mine was, others were cheaper) and a drive
cabinet with power supply is $50-$90.

If this method is either a)too expensive, or b) assumes too much
knowledge about how to put the hardware together, then I would
as I said, recommend the INDUS.

By the way, the CP/M version of the ATR-8000 is about $450 (? price has
been dropping) and for and extra $599 (? again) you can get the Co-Power 88,
which will run IBM compatible software and comes with 128k. The ATR-8000
is made by SWP Inc. (I forget what it stands for, just see any ANALOG or
ANTIC magazine)

Infocom has just released (or about to release), 3 new games.
The first one that I want to get is The Hitchhikers
Guide to the Galaxy. If you read the book by Douglas
Adams, I am sure you will want to get that one too.

Two others are also being released. They are
Cut-throats and Suspect.

Cut-throats is supposed to be out now, and the other
two in November of '84.

I would have posted this to net.micro, or net.games,
but I feel atari owners are the best ones of all the
micro owners.

Let atari live FOREVER!!!!!!!!!!

I was thinking very seriously about buying the Microbits MPP-1000 modem for my Atari 800, because it seems like a great modem, especially considering the very reasonable price they are asking. But I have heard recently that because the modem uses the joystick port (which *supposedly*runs at 130 baud) that the modem can't do any faster than this. Is

this
legitimate? Would Microbits have made a 300 baud modem that could only in practice do 130? And does anybody know anything else abou this modem that would be instructive for me to know. Or is there another modem of comparable cost that would be worth considering? All comments are much appreciated.

Dave Iannucci. (or the Vicar)

On behalf of a friend:

We have a broken ATARI 810 disk drive. I am looking for help on either of
the following

1. Can I get the mechanical and electrical drawings for the ATARI 810
    somewhere?

2. Can someone suggest a fix to the actual problem?

The drive, when powered on, starts spinning the diskette, but does not load
the heads. Further, the drive does not stop spinning.

Does anyone know of this problem and a fix, or can point me to someone
who would know? Our local ATARI service center closed I hear
(Central New Jersey) and we do not know where to go. If we at least had
documentation, we could trouble shoot it since we have no shortage
of engineers here.

Thanks

<Let there be bytes!>

I known nothing about the Microbits modem, but the Atari joystick ports are
parallel output via a standard PIA (peripheral interface adaptor) chip off
the 6502's internal bus. Therefore I see no reason why the speed limit
should be any where close to 13 bytes/second (parallel equivalent of 130 baud).
I imagine that the program limits it more than the hardware.

The rumor about 130 baud may have arisen form the fact that the Atari
internal operating system samples the joystick ports at n times/second (60?)
and copies the data into "shadow registers" in RAM. Thus, if you check the
input from the PIA by looking at the shadow registers, then there is
certainly a low speed limit. I don't think it is very likely that this is
how uBits does it, however.

Burns

I am considering getting a Koala Pad for my 800, and I would appreciate
hearing from persons who have it. I've played with it in the store and
it seems pretty impressive. I'm wondering about its reliability and
if it does fail how difficult/long to get it repaired. Also, there are
a couple of commercial programs available to allow the pictures to be

printed; if you have used these to print on a dot-matrix black/white printer, does the software use emphasis/overstrike in an attempt to print shades of gray. Are there public domain programs available to print Koala Pad pictures? Any and all comments will be appreciated. Thanks!

Allen

I've had a koala pad for about 6 months. I like it a lot and it seems
to be holding up well. I've found Basic listings in Analog or Antic
that translate Koala files to Micro-Painter files etc. I'd expect there's
enough information out there to allow you to print files and cause them
to display from other programs, but I've not been in any rush to do that
and don't have any specific experience.

However, one feature the SOFTWARE dosen't have that I'd like, would be to
allow user definable brushes. This feature is important enough to me that
I'd like to write my own software. A friend of mine who also has a Koala
pad has been having great difficulty in writing a program that correctly
reads the pad. The problem seems to be that the A/D values 'glitch'
periodically. He's tried techniques like reading it multiple times
and comparing for identical values hoping to edit out these 'glitches'
but has so far been unsuccesful. Obviously it can be done, as the
software that comes with the pad does it well, but there was no doc's
on how to do this. I was in a store one day that had lots of Apple software,
and there was some sort of Koala programming kit for the Apple, and I thought
that the information might be in this type of package for the Atari, but
I haven't found one yet. Unfortunately this is all low on my priority list
so I haven't progressed much in the last few.

One other thing-- I found that after a few uses of the pad, the stylus
begins to wear down. It's realtively soft plastic, and the pad surface
is slightly rough. I file it periodically, as a blunt tip requires
more pressure as its covering more surface area, making it difficult to
use for some people. The Atari pad's stylus probably couldn't be filed
similarly if the tip begins to blunt, but the Atari pad has a smoother
surface, and may not require it anyway. I'd like to hear from anyone
who has had an Atari pad for a while, and if there are any long term
usage problems.

On another subject, has anyone seen an Okimate 10 up close? This is
a cheap ($299?) color printer for the Atari that uses a ribbon cartrige
that looks a lot like an audio cassette. It also dosen't require an 850
or equiv. in a non-xl machine. I'd sure like to read a review.

A friend and I will be purchasing modems for our Atari 800s in the near future and
could use some advise from those of you knowledgable on the products available.
Here are is what I have heard or read about the Atari modem:
Organization: John Fluke Mfg. Co., Everett, WA
Lines: 17

     Atari 1030 -
          direct connect
          300 Baud transfer rate
          can store 2 telephone numbers
          Telelink 2 software included in modem
          you can connect and read billboards and print material,
            but cannot up or down load information to disk or cassette
     Price ~$69.00

Please correct or add to the information above. We are also looking for
alternative to the Atari if the price is reasonable, (under $100.). An exception
would be if the modem software could access a disk drive or cassette.

                         Thanks in advance
                         Dale Chaudiere
                         Pete Wittenberg

I'm having a problem with my Atari 800. When I'm editing a BASIC
program the computer will crash after anywhere from 1 edit to ?
This really upsets me. I have a cassette recorder. It would take
all night to repeatedly save the program after every few edits. Has
anyone else had a similar problem? What can be done to fix the computer?
Thanks in advance.

!bob   Oct 21 09:17:00 1983

 I have a problem with slowly drifting bars of distortion floating across the screen of my Atari 800.
The bars are horizontal, about 1/10th of the screen wide and take several seconds to drift upwards. The text or game is visible behind this fuzzy patch, but resolution is lost, and it's very distracting. The problem can usually be corrected by turning the machine on and off multiple times or opening and shutting the lid several times. The appearance rate of the bars and the drift speed are very constant.
Any ideas on the cause or cure?

Thanks for the mail I've received about the Atari lock-up problem.
I called Atari and they told me that if I'm editing with the
cursor I should do so at the top or middle of the screen, but definitely
not the bottom of the screen. Also if you renumber lines you should
do so backwards about 5 at a time and then list the new lines.

I've had it lock up toward the middle so I would suggest doing it
as close to the top as possible (what a pain!).

Lines: 37

    I am experiencing a problem with BOOT type cassettes.
    (Atari 400, 810 recorder.)
    Seems that after an hour or so the game goes berserk!!!

    This has occured with two different machines and two
    different games....

    For instance, while playing Stellar Shuttle, the meteorites
    would suddenly appear as half-moons, the shuttle would
    travel at a slower speed, and subsequent restarts would
    not affect the game, thereby calling for a tape reload,
    which is a real pain...

Eventually, all control of the game would cease.

I feel that possibly I am experiencing flakey
memory! Could even be a heat problem.

Any comments? Anyone have a good memory test
program to donate?

P.S. I might add that this problem is very consistant.

Also, anyone know of a disk available in the price
range of the Comm. disk? I'm getting tired of the
cassette, however I'll be darned if I'm gonna pay
the price they're asking for Atari disks when
Comm. is so cheap..
(Seriously thinking of C64 if the price goes down to
the $125. range...)

Thanks,

Ray Jender

RANA and TRAK are both producing disk drives for the Atari
computers. They are single or double density and cost about
300 to 350 mail order. Also look around for Atari`s 810 disk
drives at K-mart, Venture, or other discount store
for a real bargins on a display models. A friend
bought one for $200.00 dollars. Alas it was their last one and
they just wanted to dump it since they were selling the 1050`s.
The 1050`s go for about 380 which is a lot better than the
price for an new 810.

Remember that Atari products ,the old line anyway, do not
interfer with anything. My television puts out more EMI than
my computer or disk drive.

Also if you buy an atari disk drive it is worth your while to
get their service contract on your system. When my parents
old 810 (one of the first ones made) broke and Atari replaced the
entire mechanical guts for nothing.

ihuxf!bryan
Bryan K. DeLaney
BTL Naperville IL

P.S. The Atari 810 disk drive is actually a MPI model 51 disk
drive with Atari`s own controller and power supply boards.

I haven't had the problem exactly like you described it,
but I did have a home-made (Atari) Basic program which
I wrote to monitor my air conditioner operation. (Yah,
it was in August; even we Italian's don't run our air
conditioners in November.)

After about 3 days, the program just died, and wouldn't
restart. In fact, READY wouldn't come on, and it wouldn't
boot.

This (mad EE's) solution was to: 1) Open the cartridge

cover, 2) Jam a piece of paper in the interlock, so the
power was restored to the machine, 3) Removed the cover
from the Basic cartridge, so only the printed circuit
card and ROM where there, 4) Set the machine on a book
to encourage convection cooling.

They solved the problem.

I did not look for a minimal subset of all those tricks,
I just wanted to get back on the air.

The machine is a 400, purchased about 6/83. The cartridge
was new in about '81.

Good luck,
Mars Gralia

About the TRAK Atari drive, the following information is from
Trak's own literature:

There are three Trak drives for the Atari, the AT-1, AT-D1 and AT-D2.
The AT-1 is a double density drive that includes some nice bells
and whistles such as an LED track indicator, touch sensitive switches,
and write protect and density indicators. Upgrade kits include a parallel
printer interface with a built in 4K print buffer (upgradeable to 16K)

The AT-D1 is a SINGLE density drive with the above buttons and such,
but INCLUDES the 4K print buffer. You can upgrade to double density

and to a 16K buffer.

The AT-D2 is the top of the line, and includes the double density AND
printer buffer.

By the way, the double density is TRUE double density (176KBytes), unlike
Atari's new 1050 drive. Also, the Trak drives, like the Atari drives,
have a serial port to allow chaining of a cassette recorder, etc.

The most interesting thing about the Trak is it's "Turbo" software (their
name, not mine!). With their software (optional, I believe), the drive
reads 16 tracks at a time into the printer buffer (if it is not being
used for the printer, presumably) and the drive is intelligent enough
to look in the buffer first for a requested track. Trak claims speed
increases of up to 18 times any other Atari drive.

Other features include quicker shutdown time than the Atari drives
(4 seconds vs 8 seconds) and automatic self diagnosis, using a 1/2
second long built in diagnostic program. Diagnostic reports appear
on the screen or the printer. The drives are also about half the
size of the Atari 810's.

I have seen an ad for the Trak AT-D2 and, if memory serves, it
was about $380 dollars (no operating system with it. If you want
to use double density, I suppose you need OSA+, which Trak has
told me is completely compatible with the drive).

BY THE WAY,
my office partner has had an order in with Micro Mainframe for their
dual double density Atari drives since March, and has still not received
his order. They keep telling him that they are about to ship, but
some problem or another keeps cropping up. Has anyone out in netland
actually RECEIVED a Micro Mainframe Atari drive? Has anyone had
similar problems? We would be interested in hearing about them.

Somebody told me that Atari is coming/has come out with some 64K computers which I assume are supposed to compete against the Commodore C64. Does anybody have any word about or experience with them? How much of the 64K is accessible to the user? Are there any expand modules available for them like the CP/M cartridge and the Apple emulator for the C64? I also have a question about Atari disk drives. The C64 drives are slow, largely because of the serial interface. How do the Atari drives fare in comparison?

Thanks a lot for all replies. Since this info is probably already known to most of the readers of this group, please reply to me via mail.

Does anyone know if there is software available to dump Atari screen graphics to an Epson MX-80 printer with Graftrax-Plus? I thought I'd try this newsgroup first before I call Epson.

[This line intentionally left non-blank, to satisy news]

I have had experience with 3 Atari 800 computer exhibiting the
'horizontal bars' problem. All 3 had begun doing this after
memory was added. This looked suspiciously like a power supply
problem; the units had passed the factory test with the 16k
originally installed, but were not up to spec with the additional
load of more memory.

    An oscilloscope on one of the offending units confirmed
that there was oscillation on the +5 and +12 lines, so I got out
my trusty soldering iron, and soldered some high-quality, silvered
mica capacitors across those lines. They are available at the front
of the computer, under the keyboard. Usually there are already
some small glass capacitors that look like diodes there. Leave them,
and parallel any needed capacitance. It doesn't take many picofarads,
just fast ones.

    This fix totally cured all the computers, maybe it will help
yours.

                  --Sir Spam the Roadie
                    (John Rehwinkel)
                    ...!umcp-cs!eneevax!spam

PS: My computer, which is dropped/frozen/baked often, never has any
     problems of any sort, the ones that get sick are the ones that
     get the velvet-cushion treatment. Apparently, Apples need this,
     but the Ataris take umbrage at being treated like unliberated
     women.

Would it be worth my while to:

Purchase 48k mem. board?
How about one of those direct replacement keyboards?

Anyone done the above? What are your conclusions?

Or should I wait till the 800 gets to the $139. range?

Also, how about a disk drive review? Anyone have anything
to say about the Rana 1000, Trak AT-D1?
What about the Astra 1620, with double disk, double density
for $595.???

Respond here or send mail to me.

Thanks,
Ray Jender

I have to agree wholeheartedly that the Atari toll free is used for a lot more than complaining about non-working equipment. I have called a few times myself to find out about the availability of new products, etc. They have always been courteous and helpful. They have never complained that I used their toll free number for such frivilous activities.

Thanks Atari!

I'd like to add a port to my 400 so I can attact a monitor.

1) Where do I wire it into the 400? (I think I can get
the schematics for both the 400 and 800.)

2) What can be done to get audio out too?

Thanks,

I have also experienced the horizontal bars on my atari 800.
However, the common fix of putting capacitors across the power supply
didn't help my situation.
I also looked at the power system with a scope and could find nothing
unusual.
I even had another 800 open at the same time and compared the two systems.
Then i resorted to basics - see if anything feels unusually warm.
I found that one of my large filter capacitors (4700 UF i believe) was
much warmer than the other.
The capacitors on the other 800 i was using for comparison were cool.
I would have thought that a defect of this kind would reflect in high ripple
and/or low input voltage into the regulator but neither was the case.
At any rate, replacing the capacitor fixed the problem.
Good luck.

#text follows

According to the Wall Street Journal (Nov. 10, 1983) Atari is going to raise prices on its computers, video games, printers and disk drives.

> "Atari said yesterday it will raise prices charged to retailers $40 on its 600XL and 800XL computers to $180 and $280, respectively."

Price rises will be effective Jan. 1, 1984. I doubt that you will be able to buy a 600XL for under $199 then so you might want to try to get one of the new ones before then. That might be a problem though as the article went on to say:

> "Atari also can't fill 40% of its retail orders for the 600XL and 800XL through Christmas because of production snags in Hong Kong. Atari...isn't taking any new orders for the rest of the year; and the shortage will continue into early 1984."

Reasons given:

> "Atari spokesman said, `Atari is really sending out a message--we don't intend to sell superior products at unrealistic prices.'"

I called the Atari hot line to inquire about the 1400XL and 1450XLD and was told that they would not be available until early 1984. Although no firm prices have ever been set for them, I am sure they will also reflect the price increase noted above. That is, they won't be as cheap as some magazines are speculating they will be.

Cheers...

I thought I'd spark a litlle interest in this net by revieing APX's Deep Blue C Compiler. I was really attracted to this compiler because it had a lot of predefined functions that I wouldn't have to write myself. They include I/O , graphics and player missle graphics.

My initial goal in using this compiler is to create a growing library of modules (functions) that I could plug together in various games and graphics programs. I won't go into to much detail as to what the compiler has and doesn't have because that information is in the APX catalog. Compilation time is a little slow for my liking, it takes about 3 - 5 minutes to compile and link a small (100 line) program. Also, disk space runs out fast because the compile and link programs are big, but a 2 drive system or 1 double density drive could solve that problem I'm sure. Since I have 1 drive I keep all compile files on 1 drive and all link files on another drive. When I get a CCC file from the compiler I transfer it to the link disk and link it from there. The graphics and player missle graphics libraries are really nice, a lot of the commands are just like equivalent Basic commands. I have had lots of problems with th plmove command

and I suspect it has a bug or two in it. It wouldn't be hard to rewrite the function which is what I might end up doing. Another nice thing is that the source code for all the functions are given. Also, two programs are given for examples. Reading the source code for the Bounce function can tell you a LOT about how to use the player missle commands. I just found out that a math library is available from APX ($17) that will include the type float and math functions. I think that all in all the Deep Blue C Compiler is an excellent value for $50. With the new Atari Computers coming out you will be able to have a 64k disk C system for less than $650 ($335 for drive, $250 for 800xl, advertised discount proces). By the way, if you want to learn C I reccomend that you get a copy of "Programming in C" by Stephen Kochan, published by Hayden, it is an execellent and easy to read book. I don't work for Atari or APX and I don't sell these programs, nor does this article reflect the opinions of my employer, Western Electric. As my library of functions for the Atari grows, I will be willing to share or trade what I have written with other users of the net. Let's see some other reviews of products for the Atari on this net.

If you you want a faster compiler, you might consider looking at ACTION! sold by OSS. This is not a C or PASCAL compiler, but it is easy to learn for anyone who knows either of these languages.

I shouldn't say any more since I am highly biased on this point (I'm the author), but I thought it would be worth pointing the that it exists in case you weren't aware of it.

For Sale one Atari 850 interface module with terminal emulator.
Price $175

Includes documentation and The Chameleon Terminal Emulator
which does not need the basic cartridge. The Chameleon will
emulate the VT52, Glass TTY,and the Adm 3a terminals;
Has 40 41 80 81 128 129 columb display options and up to 8 pages
of memory (48k system). It will up/down load ascii or binary files,
and it works great with UN*X (gives you the FULL ASCII set).
With the emulator you can use any or all of the four serial interfaces.
This gives you the ability (assuming you have 4 phone lines) to be
connected to 4 different machines at once. This is about the best
terminal program you can buy for the Atari computers.
I bought the disk version but it should not be to hard to put
it on tape if need be.

Price $160 without terminal program.

There have been several notes about the above. You need an
Apple running CP/M (not necessarily but this is a good way) with
disk drive and 80 cols. You need a serial card (I recommend the
CCS 7710D) and a modem.

Next you need software. ZTERM Professional is very good with a nice
macro capability for about $120. However, MODEM7 has everything
but the macros AND you get source code, plus batch transfers of
files to another MODEM7. The latest version around that I have seen
is MDM712.COM. There is an associated library called MDM712.LBR which
contains the object code, documentation and a bunch of overlays for LOTS
of different computers. This is a public domain program that is widely
available on bulletin boards.

There a couple of versions of UNIX programs that implement the XMODEM
or Christensen protocols that modem7 uses. I have seen umodem and tmodem.

Forgive me for errant path name in earlier message...
I've developed TECO for the 6502 on my OSI computer. It is about 98% of
the V29 implementation and growing. I'm considering porting it to the
Atari and Apple computers. Is there much interest in this?
Thanx,
Bob Ankeney

I am in the process of attempting to expand the memory inside my wife's Atari
400 home computer. I can't see the point of spending approx. $120 for a
memory board when the computer itself only cost $60 (with rebate). Has anyone
come up with a mod for the 16K board that comes with the 400 that will allow
expansion? Or can anyone turn me on to a construction article? Thanks.

I am having some problems with BACKSPACEing on my BIT3 80 column board.
When I hit the Backspace key instead of backspacing it either causes a
terminal lockup or it gives me a tilde and if I hit the backspace key
two more times then it locks up. Hmmm...needless to say...this is
causing some consternation...
           Anyone out their having experience with BIT3 please tell
me if this is a normal everyday *bug* or one that is unique to my
card. I either need a workaround or need to return it to the vendor.
                                  merci

  Over the last few days, my Atari 800 has been acting up.
When I turn it on, about 99% of the time all I get is a screen
full of miscellaneous charaters. Occaisonally, System Reset will
clear the screen, but very rarely. This problem occurs with or without
a cartridge in slot A.   Has anyone had the same problem?

I have just recently purchased an Atari 800 will shortly
be in the market for a disk drive. In researching the market,
I find several producers of disk drives available. If anyone
has any information (either personal experience or magazine articles)
on any disk drives for the 800, please send information directly to me.
The disk drives I am aware of are the Atari 810, Percom (not sure
of model numbers) and the Rana 1000. Any type of information
on these or others would be appreciated. If requests are made I
will summaraize and display on the net in the future.

I recently purchased the new Atari 600XL, and I'm having considerable
trouble obtaining information about the parallel bus output which the
new XL line has. Does anyone have any info or know where I might find
it? It would be great to design memory-mapped peripherals using this
bus, but Atari doesn't include a bit of information about it in the
documentation (which is poor anyway).

In answer to a question asked a while back about an interface for the
Atari so that a standard cassette deck could be used, the February issue
of "Computers and Electronics" has a construction article on just what
you want. You can even send for a complete kit of parts including the
PWB for $29.??. You can also buy the Printed Wiring Board by itself
if you have a source of cheap or free parts. Another consideration you
might check out locally is the now discontinued 410 recorder. I saw them
for $39.95 at a local Venture store the week before Christmas. At that
price, it might be a better investment since looking for your portable
recorder or tape deck every time you want to use it can be a hassle.

Hope this helps...

Is anyone going to go the Winter Consumer Electronics Show? If so, would
you stop at the Atari booth and find out the latest about the 1400XL and
the 1450XLD? Find out when they plan to have them available and the price
if it has been set yet. Also, I would be interested in anything new that
is announced there for Atari (either from Atari or other companies). Either
mail me what you find out or post it here since I am sure that others are
interested also.

Thanks...

Has anyone typed in the MLX program and the Chopperoids program that
goes with it from the December 1983 issue of COMPUTE! magazine? This
is a program that is supposed to make it foolproof to type in a machine
language program from their magazine. It only works with certain ones
of their programs. Chopperoids is the first of those programs. The new

January 1984 issue does not contain a mlx loadable program for Atari.

Anyway, my problem is that I typed in the MLX program and checked it carefully for typing. I then typed in the game per the instructions. The MLX program seems to work fine since I can save and load a partial or complete copy of the game per the instruction. The complete game is supposed to be an auto-boot game that can be loaded per standard instructions without using the BASIC cartridge. When I do that, it loads fine. That is, it loads the full program and doesn't give me an error message. At this point, a title page is supposed to come up followed closely by the game itself. Mine doesn't! My screen remains blank and it just sits there locked up. I should mention that I am using the cassette recorder although the program will also work if you are using a Disk.

If you have loaded this program and game whether you are using cassette or disk, please mail me your results. I have checked and rechecked my typing and I don't think I made a mistake. Any help would be appreciated.

Thanks...

Even though I thought I knew the answer to the question in the title, when trying to explain the difference to someone, I realized that the rash of recalls/expansions/etc. left me unable to pin down the differences.

Given that a 1200XL is selling for $200 and an 800XL is selling for

about $300, I wanted to know how much memory, whether BASIC is included,
whether known bugs/reliability was a problem, etc. for the ATARI line.
  Please mail responses to me.

The January 1984 issue of Computers & Electronics, page 77,
has an article about interfacing a standard audio tape recorder
to the Atari 400/800/...

The circuit uses a single Exar XR-2211 FSK demodulator integrated
circuit and a kit of parts is available.

Demonstrated at the December 17, 1983 meeting of the Jersey Atari Computer Group

were three graphics tablets:
1. Koala Pad - 16 sq inch active area;
2. Atari Touch Tablet - 30 sq inch active area; and
3. Chalk Board - 144 sq inch active area.
They all seem to cost about the same ($70-$80) and to have similar "paint"
programs. The Chalk Board has overlays, and can play polyphonic music
with a piano keyboard overlay and the appropriate program.

Are there other comments of these graphics tablets?

Comments mail to me will be summarized for the net.

Has anyone had any experience with or heard anything about the Indus
disk drives. I'm considering getting one for my Atari 800. It supposedly
comes with software-word processing, spread sheet, and data file manager.
Any info would be appreciated.

I have a Rana 1000 disk drive that I use with my Atari 800 Personal Computer.
This is my Rana 1000 disk drive, because my first one completely quit working.
The one I have now does not read all software that an Atari 810 or Atari 1050
disk drive will read.
Usually I have problems with protection schemes on disks that are written by
third party software vendors.

If you have had any problems with the Rana disk drive such as I have or
any other problems with it, please give me as much information as possible.
If anyone knows of any fix to cure my problem, please let me hear it.

Well, I've been doing some research on which disk-drive to buy for
my 800. These are the observations that I've heard:

Rana 1000 - From comments on the net and people I know who have
            recently purchased them, I've concluded that there
         have been various problems in operating them ($320)

Trax   I've heard there's alot of rfi noise on tv screens
         Built-in printer port ($380)

Percom   reliable but expensive, built-in printer port ($450)

Indus   power supplies have started to burn
            Comes with software - word processing, spreadsheet
         and file manager ($450)

Atari 1050 reliable, but dos III isn't out yet, and without it you
            can't use the "enhanced" density ($350)

Have any other comments to add?

Has anyone out there been able to use a TI 745 portable terminal
(or any RS232C serial printer) as a printer for an Atari 800 WITHOUT
the use of an 850 interface unit? There was an article in a
Kilobaud/Microcomputing about using the joystick ports to drive a
printer, but that appears to be a parallel port, and I need a serial driver.
Seems like a waste to buy a printer when I have the terminal at home!
Any help would be appreciated.
                        Thanks,

I have the 400 schematics (a good deal at $27 along with software doc)
and it looks like you can get composite video at pin 1 of the connector
from the motherboard to the power supply.

Separate audio should be available (with a DC offset so use a capacitor
and a high impedance input) at the ungrounded side of R163 (9100 ohms).

I have not tried any of this -- I'm just looking at the schematics.

Does anybody know anything about the "boot" that is incurred by holding down the START button when you power up? A number of commercially available software packages load their software this way. I am curious as to exactly what happens in this mode, where the loaded material ends up (is it always the same?) and where control is transferred following a successful load....

I guess this is just true of the cassette deck, now that I think about it. I don't have a disk drive (sob, choke...).

    if you find the default white on blue text
mode 0 colors an eye strain try the following poke
commands:
        poke 709,0
        poke 710,228
    these yield a black letter/green background
format which i find a lot easier on the eyes (especially
inverse video characters).

Subject: CTIA vs GTIA
X-Google-Info: Converted from the original B-News header
Posted: Tue Nov 9 04:47:43 1982
Received: Wed Nov 10 01:46:36 1982

I have an older Atari 400 with a CTIA graphics chip. I have heard that
programs written for use with the new GTIA chip may not run with the
CTIA chip. Can anyone tell me what the difference between these two
chips is? Would it be worth the trouble to replace the CTIA with
a GTIA?

Some notes to kick off net.micro.atari:

>From Creative Computing: The 5200 video game has a 6502, Antic
  GTIA, and Pokey. Aside from the other obvious things that are
  missing (e.g., serial port hardware, keyboard, etc.) software
  is sited as the major incompatibility.

  The 600 will have an RS-232 port, a full-stroke keyboard,
  48K standard, and programmable function keys. They went to a
  single board (which they probably should have done in the
  first place...) to reduce cost.

  Since I want to unload my 400, but still stick with Atari, the

  600 sounds like my machine. Compute! claims that the 600 will
  be announced this summer (1983) at the CES.

A while back I asked for info on atari-termcaps, etc.

What follows is a terminal simulator sent to me from way off in ARPA land:

To: decvax!yale-com!cutler@UCB-C70
In-Reply-To: Your message of 12-Oct-82 2259-PDT

I don't know how your message got out onto the Arpanet, but we have
a INFO-ATARI mailing list. Send mail to INFO-ATARI-REQUEST@MIT-MC
to see if you can be added on.

For crt emulation, I'd suggest APX's LIZARD (or CHAMELEON) written by
Jack Palevich (aka INFO-ATARI-REQUEST). It emulates VT52 and a couple
of other terminals I believe.

I'm going to send a set of messages that just came out today on INFO-ATARI.
They contain the code for a BASIC terminal program for the Atari. I haven't
tried it but I thought you might want it.   It will be in the message
just after this one.

Subject: ATERM file info
To: info-atari at mit-mc
Cc: abrams at MITRE

I will send the three files which make
up ATERM (my terminal emulator) in seperate
messages. The file names, which are
coded in are: ATERM. (the main program),
ATERMPT2. (the second part of ATERM),
and ATERMHLP.TXT (a help file). The first
two are BASIC programs.

If anyone has a major problem in downloading
or makes substantial improvements, let
me know.

You could use another cassette but then you would have to go find a funny
I/O plug (about $10) and you do have to worry about motor control.
The audio channel on the cassette is nice but not very useful for most things.
If you're into foreign languages on the introductory level it's ok.
I've seen a few games that do interesting things with it, but that's about all.

The 800 has a plug on the side to let you get at the video and audio signals
before they're RF modulated. The 400 has no such plug but perhaps you could
get at it inside the case. You'll have to check the Hardware Manual (see
below), I'm not certain if you can.

810 disks are no problem. The 400 may look different than the 800 but
they are virtually software and hardware identical. You just need at least
16K and you're off and running.

Call Atari in California (800-538-8543) and ask for info on the 400/800 system.
Or look in a local store for:

Operating System Reference Manual
Hardware Manual
Operating System Source Listing
Disk Operating System Source Listing
De Re Atari (Explains lots of neat stuff)

Compute is a good magazine for Atari.

The GTIA chip implements three additional graphics modes:

1. 16 colors, 1 intensity level
2. 1 color,   16 intensity levels
3. 9 color and intensity combinations.

All modes use 4 bits per pixel. Each pixel is one scan line high,
so there are 192 pixels vertically. However, each pixel is two
(four ?) color clocks wide. So, a pixel is four dots wide! You
get pixels that are elongated horizontally -- they are not square.
There are 80 pixels per scan line. Player/missile graphics is the
same as before.

Atari will probably continue to produce software for the 400/800's
that have the CTIA chip. Conversion is probably worth it since it lets
you do some interesting things. Or wait for the 600, junk the 400,
and get the GTIA chip, 48K and a real stroke keyboard.

The great 6502 compiler void seems to have been filled. There is a C compiler
available, details follow:

C/65 now available

- first native mode C compiler ever produced for Atari and Apple computers
- integer & char types, arrays, pointers, recursion, much more
- requires MAC/65 or equiv. assembler
- 2 disk drives recommended but not required
- $80 US
- MAC/65 $80 US
- incl. OS/A+ operating system

- Optimized Systems Software, Inc.
  10379 Lansdale Ave.
  Cupertino, CA 95014
  (408) 446-3099

Does anybody know where one can get a unpopulated 32K RAM board for the
Atari 800. I have a batch of 3 supply 16K DRAMs I'd like to put to good use.
Also, I understand that the guts of the Atari 5200 is identical to the
400/800 computers. I'm wondering if it is possible to adapt the game car-
tridge or just the ROMs from the 5200 to run on the 400/800 computers. I've
seen some games available for the 5200 that aren't available for the computer.

Received: Fri Nov 12 02:37:32 1982

NEW PRODUCT RUMORED!!!!!

Whilst purchasing games at a computer store in NYC, the subject of
trackballs was raised. Some of you may have heard of or seen the
WICO trackball, which is really a joystick emulator (you roll the ball
up, it sends pulses along the up line, etc). I was informed that
Atari itself was coming out with a track-ball for the 400/800 as well
as one for the new 5200. My comment at that point was, "It would sure
be nice to be able to use it with Missile Command(tm), but since it is
totally different from a joystick, I guess we'll be forced to buy a new

version of the game to use the ball."

The salesman then told me, "No, the Missile Command cartridge already HAS
a 'track-ball' option built into it. All you will need to do is hit
CONTROL-T to put the game into 'track-ball mode'!"

I have tried it, it really does switch input modes! The stick no longer
works, but the ball is apparently not going to be simply two paddles,
because they don't work either.

The arcade Centipede(tm) also uses a track-ball, but CONTROL-T on that
cartridge doesn't appear to do anything. Maybe there's another 'switch
character'?

Not afraid to leak rumored products,

Subject: atari 2600 & atari 400
X-Google-Info: Converted from the original B-News header
Posted: Tue Nov 9 10:36:21 1982
Received: Tue Nov 16 02:42:34 1982

Well, It's good to be here at the begining of a new newsgroup. I
would like to make a plea to net.land for information leading to
the source code for my atari 2600. I'm not looking for code to
any specific games, but rather I would like to write my own games,
and have access to the graphics commands.

For those of you who have not taken your 2600 apart yet, there are three
major parts inside. First is a 6507 CPU (a 28 pin version of the 6502)
Second is a part which appears to be a 6532, which is RAM, I/O, and
timers. The last part is manufactured by OKI and has the part number
MSM3980. By defalt, this is the video controller chip. If anyone
has information on this chip I would be quite interested.

Lastly, is the above mentioned video chip the same as in the ataria 400?

I would greatly apreciate any help or information which I could get
frm the folks in net.land. Please reply by the net.

Thanks

I have no idea what this is, but it is from COMPUTE! magazine, and somebody
went to the trouble to upload it for the arpanet, so I thought I'd put it
up here for everybody's benefit. Maybe somebody can even tell me what it is,
so I don't have to actually look at it....

Apparently what's happening is that net.micro is forwarded to info-micro,
and since net.micro matches net.micro.all, all the half dozen subgroups
(net.micro.atari, net.micro.pc, net.micro.68k, etc) also get forwarded.

Would whoever is responsible for the gateway please fix it, and also
drop me a note so I know where the gateway is? Thanks.

Mark

Thanks to those who responded to my Atari 400 questions a while ago. Brief summary below. However, no one got the non-Atari cassette deck answer quite right (I did some digging and found out the story).

- Yes, you can get at separate composite video and sound signals in the 400, since the 800 makes them available and the 400 is identical internally. You would have to open it up and goof around with the schematics though.

- It would be difficult to use a non-Atari 410 cassette player with the 400/800 because they pull a neat trick on the cassette I/O. The computer spits out encoded audio (FSK, something like 3992 and 5327 Hz, 600 baud) to the 410, but what the 410 sends to the 400/800 is TTL-level (0 and +5 volts)! So the 410 converts the FSK stuff to TTL-level itself. Actually this could be a very nice way to download to the Atari, and it also should be quite easy to read Atari tapes from a 410, given an I/O line and the tape record format.

- You can use 810/815 disks with the 400, possibly even with 16K, but then you wouldn't have much room for Basic. Memory expansion cards to 48K exist, but are not without problems. The thing about the 400 is that there is only room for one card, so to get 48K you have to remove the Atari 16K board and put in a 48K board. These cards can cause problems with screen clarity, either because of power supply limitations or RFI due to poor components/layout. Putting 48K on such a small board is no picnic (they use 4116's I think). The Mosaic 32K board is supposed to be excellent, and it comes populated with 16K - the other 16K you pull out of your Atari board.

- Many reference manuals for the Atari 400/800 exist, the Hardware/OS manual, the Atari Technical Manual (for assembler prog. info), the book De Re Atari, etc.; commented OS ROM and DOS listings are available from Atari.

You can get a couple of different keyboards for the 400 that I know of; a new

one coming out soon costs only around $100, and installs in 5 minutes. New games I've heard are coming soon are Zaxxon, Donkey Kong, Tron, E.T. (?!), and Defender.

     Recently, I inquired on the net.micro.atari about the availability of bare memory boards for the 400/800. The October-November issue of ANTIC contained an ad in the back from an outfit called Tiny Tek Inc. They advertised bare 16K,32K,and 48K boards for the computers for $12.50,$30, and $50.00 respectively. I quickly placed a phone order and had the board in my hands 3 days later (I didn't know the U.S. mail could move so fast). It came with resonably good instructions and schematic. The board it self is of excellent quality. Glass epoxy, gold plated edge connector, plated through holes and wave solder pretinned. For anyone who is interested the outfit is:

Anybody know of some good financial management (homd; checkbook type stuff) for the Atari that is available on cassette (or have a disk drive that that would like to give me)?

Speaking of cassettes, has anybody notice any decay of tapes, and/or have any idea what the projected life of software on tape might be? I have kind of a lot of tapes, and some that I would not like to lose. Any idea?

Regarding lifetime of Atari tapes; if they're Basic, obviously you can trivially back them up all you want. For machine language tapes, there is a company (I think Vervan Software?) that sells a program on cassette that copies machine language cassette tapes. The ad was in Oct/Nov Antic.

Has anyone heard anything about the Atari CX70 light pen? Saw it in a recent Byte ad for $64 US. Does any software use it?

I am a hardware/software hacker. I brought up figFORTH on my S-100
Z-80 based system a couple of years ago, and last month I bought
valFORTH (a figFORTH derivative) for my ATARI 400.

I have found the FORTH system (combination interpreter, compiler,
editor, disk manager, etc.) useful for my style of hacking. I like
the built-in number base conversion; I like the simple access to
I/O ports and absolute memory locations; I like writing I/O drivers
with a combination of high level and low level definitions when I am
debugging hardware, software and driver logic simultaneously; and
I am impressed with the assemblers and interpreters which can be
defined in FORTH in a few screens each.

I find the figFORTH editor awkward, but other FORTH editors are
available which are easier to use. In summary, I find FORTH a useful
tool for some of my hacking, but I also find assembly language, BASIC,
PILOT, C, etc. appropriate for other applications.

The last thing I heard about the ATARI CX70 light pen is that ATARI abandoned its development since they could not get it to work correctly. The hardware still supports a light pen (ANTIC?) and I have seen independent manufactures offer light pens. The atari handles light pens by reading the horizontal and vertical position registers whenever the pin for the trigger button is activated. It is possible to demonstrate this by simply entering a basic program to continuously read these locations (RAM low memory) and press the joystick button everyonce in a while. This function is done entirely in hardware, and the light pen position registers in hardware are copied to RAM during vertical blank, as are the other hardware registers.

Let's say I have a program that uses the random number generator (RNG).
I turn on the computer and load a program that uses the RNG.

Question: will I get the same sequence of random numbers every time
I use this program if it is always used *after* a cold-start boot?

I'm somewhat confused about the real nature of the random generator
and the De Re Atari is not much help. Comments anyone?

Location (702) contains the shift/control lock flag.
     0 == no locks on,
       64 == caps lock on (the normal state in BASIC at least),
      128 == control lock on.

Location (756) selects the upper or lower case character set
for use in screen modes 1 and 2. In normal text mode, location (756)
is the pointer to the display character set memory page, allowing one
to redefine their displayed character fonts by entering a 1024 byte
bit map and storing the starting page of that map into (756)

Hope that helps. (Info was from "Your ATARI Computer", Ion Poole,
Osborne/McGraw-Hill)

On November 9, Ben Cutler posted to this newsgroup a terminal emulator
written by Marshall Abrams (abrams at MITRE) received from the ARPAnet.
The emulator was supposed to be in three files (ATERM. , ATERMPT2. , and
ATERMHLP.TXT), but the news item received here was missing ATERM. , the
main program.

Did anybody receive the ATERM. file in their copy of the news item or
in followup communications? I sure would like to get a copy of it
to try that terminal emulator on my ATARI 400!!

Do any of you have any of (at least two that I have heard of) the 80-column
cards for the ATARI 800? I have been using my 800 extensively as a terminal,
and the idea of 80 columns is very appealing to me? I am a little worried

about the appearance of the letters and the screen clarity, though. Does anybody know if they are compatible with, for instance, APX's Chameleon terminal emulator (or other terminal emulators), and if they are acceptably clear?
I have a monitor, so I think it will handle the bandwidth....

I have a couple of questions that I can't seem to track down answers to...

1) Is there any way, from BASIC, to force the upper/lower case switch before accepting input from the keyboard? I am writing a program where I want the input to be in lower case sometimes, and upper case others (as bad an idea as that might sound...), and I'd like to remove the responsbility from the user. There is a memory location which deals with this (756), but I can't seem to get results, for one reason or another. Anybody have any ideas?

2) I can't remember what the other thing was....sorry.

Thanks.

Todays issue (12/14/82) of the New York Times contains a picture and a not very technical article about the new Atari 1200XL computer. It's on the fourth page of the business section. From the atari club I belong to I've found the following sketchy details:

64K of on board RAM (I don't know how much of it is accessible)

Built in RS-232

Built in Microsoft Basic

Compatible with existing 400/800 software

No expansion slots

Suggested retail price of $900-$1000

The lack of expansion slots seems to be the biggest drawback of the new machine. The two nicest expansion features one could get for the 800 is the 80 column card and the RAMDISK. I've seen the 800 with 16K discounted to $499 in the New York City area at that price I think its the best value in personal computers.

I don't know how your message got out onto the Arpanet, but we have
a INFO-ATARI mailing list. Send mail to INFO-ATARI-REQUEST@MIT-MC
to see if you can be added on.

For crt emulation, I'd suggest APX's LIZARD (or CHAMELEON) written by
Jack Palevich (aka INFO-ATARI-REQUEST). It emulates VT52 and a couple
of other terminals I believe.

I'm going to send a set of messages that just came out today on INFO-ATARI.
They contain the code for a BASIC terminal program for the Atari. I haven't
tried it but I thought you might want it.   It will be in the message
just after this one.

From: Marshall Abrams <abrams at MITRE>
Subject: ATERM file info
To: info-atari at mit-mc
Cc: abrams at MITRE

I will send the three files which make
up ATERM (my terminal emulator) in seperate
messages. The file names, which are
coded in are: ATERM. (the main program),
ATERMPT2. (the second part of ATERM),
and ATERMHLP.TXT (a help file). The first
two are BASIC programs.

If anyone has a major problem in downloading
or makes substantial improvements, let
me know.

  us     CTRL+* or SHIFT+TAB
************************************
>> File transfer & other features  <<

Press START to capture downloaded file.
(More explanation below.)
Press OPTION to activate all other
options. A menu will be displayed.
************************************
>>         Getting Started         <<

After the instructions you will be
given several choices. In each case,
you may select the default by pressing
RETURN. This is recommended unless you
have a good reason for another option.
The first set concerns translation:
    Light ASCII translation (default)
    Heavy ASCIi translation
    No translation
The next set concerns output parity:
    None (default)
    Odd
    Even
    Set to 1
The last question concerns line feed:
    Append line feed after return
    No line feed (default)
After setting these options, the main
```

program will be run.
****
>>   DOWNLOAD FEATURES   <<

Press StART to toggle the memory
buffer switch, e.g. to begin saving
material to buffer and to stop saving.
You may start and stop saving to buf-
fer as many times as you wish. Each
time you toggle the switch ON the
number of characters of free buffer
are displayed (over 25000 for 40-48K
RAL). If xou run out of buffer the
program will automatically send an
XOF to the hst computer and prompt
you for a disk file name to save the
memory buffer.

     Anyone willing to give a pauper some software(games)
for the Atari 400?? Can't afford $25-$35 for the available

stuff on the market. No disc, just cassette.
Thanks:

Received: Wed Dec 22 08:20:53 1982

Has anybody seen a terminal program for the
atari that allows for 80 character displays ?

What I am looking for is something that allows
me to look at first 40 characters of a line, then when
I move my cursor to the 41st position, the next character
is scrolled in from the right of the screen.

What would be real neat, is use my joystick to move the
screen around ,like Eastern Front does, to look at text.

The Atari Program Exchange puts out a package called Chameleon. This program allows either a 40 or 80 column line, and if 80 columns is selected, uses horizontal fine scrolling under control of the START key. The program retails for about $22.50!, and is well worth looking into. If you can't get it from your local Atari dealer, you can mail order it directly from APX. I don't have their address or phone number, but you might try calling the toll-free information operator (800 555-1212), as they have a toll-free number.

Having just read some mention of APX, I would caution anyone considering purchases from them to be cautious. I don't know about floppy disk versions, but I tried to purchase the cassette version of "Black Jack Tutor", got a tape which didn't work, was subsequently told they couldn't get it to work, agreed to accept another program which didn't load properly, and am still waiting for a third replacement. My original purchase was supposed to be for my son's birthday last April 6. Caveat Emptor!

Anyone know of a good utility to print screen images in graphics
mode 8? I've used an APX program that prepares astrology charts
in graphics 8, but there is no way to produce a print.
Can anyone help or offer advice on the general problem of getting
nice screen prints for the Epson MX80 with graphtrax plus?
Thanks.

I have, over the past two years, had much experience with APX programs, mainly
diskette versions, and have had only one such program which would not load
properly. The program was promptly replaced by APX, and the replacement
program ran flawlessly. There are many *excellent* buys in the APX catalog.
I would, however, recommend buying the programs from a local dealer, if possible.
This is especially true of cassette programs, which are much less likely to
load. The local dealer should be able to replace, from stock, any program
which fails to load, thus avoiding the *long* APX replacement cycle...

I have ordered two programs on cassette from APX: Chameleon and
Avalanche. Neither cassette has given me any problems. APX did
mistakenly send Chameleon on disk (!) the first time around, but
corrected the problem as fast as the postal disservice allows.

Avalanche, by the way, creates an interesting short circuit from
my brain to my hand. Before ordering a program from APX I would
suggest trying it out at your local computer store to find out
what kind of brain waves it generates!

  I think you would really like the Chameleon terminal emulator from the Atari Program Exchange. It works with the 40 column display but scrolls for 80 coulmns. It can emulate the vt52,adm3 and the glass TTY. It supports full cursor addresing and I have used it on UN*X for using the vi editor and playing rogue.

I heard an ugly rumor last night at our local Portland Atari Club meeting.
It seems that the new Atari 1400XL and 1450XLD computers have been cancelled,
even though a million dollars worth of advertising has already been sunk
into them. For those who are unfamiliar, these models had built-in 300 baud
modems and voice synthesizer chips, and the 1450XLD had a built-in slimline
disk drive -- all for around $800.

Apparently these models were cancelled because of IBM's announcement of the
"Peanut", a version of their PC for around $1000 (this model was formally
announced recently in the Wall Street Journal).

Does anyone have any more information about this (i.e. confirm/deny)? I had
gotten interested in this 1400 series because they were supposed to produce
a card cage to go with it in order to encourage other vendors to provide
a bunch of expansion boards (like an IBM emulation board, for example).
If this cancellation rumor is true, after all the tooling and advertising
has been done, I can only conclude that Atari has their head up their
you-know-what. Comments?

I am wondering if there is a termcap and/or terminal emulator
for the Atari 800 which would allow the use of vi or other
programs based on the curses package. Please reply by mail.
I will post a summary if someone requests it.

     I hate to think this is true but there is a chance Atari
dropped the 1400 & 1450 in order to get their Apple-II/IBM-PC/Atari
compatable computer out faster. With the massive enthusiasm over the
Peanut they may feel nobody would notice the 1400 & 1450. But if they
offer a 3-way compatible system for less then the Peanut then they

may have something to compete with. Now, since Atari can't seem to
manufacture 2 products at the sametime it's only natural that they
would have to stop production on the 1400 series. Gee, and I was going
to buy Atari stock, maybe it isn't to late to buy 'Puts' after all.

  After reading the article about Atari dropping the 1400,1450xl
I called Atari Headquarters in Sunnyvale Cal. . They said that
they had no knowledge of any plans to drop the 1400 or 1450 and
were looking forward to the release of these 2 machines. I asked
when the new computers were coming out and it looks like the 600xl
and 800xl are coming out in October but it will be a while longer
before the 1400xl and 1450xld are available.

Does anyone out there have a termcap that will work for an atari 800
with 40 col display?

Thanks in advance......

Perhaps this belongs it net.flame, but...
No, thank you, I will NOT respond by mail. In the past month I've seen
(it seems like) 20 or 30 people asking for termcap entries for atari
computers, most like the following:

"Uh, does anybody out there have a termcap entry for a 40
column atari 800???"

How can anybody answer this??? After all, he could be running 10 different
terminal programs, with 20 different modems!

Now, lest you all think this message merely a flame, pertinent information
follows, please read it!

A little history first. I've been working on UN*X for about 5 years and
when 3 years ago I decided to get a terminal for home, I figured -- Why not
get a computer instead? Then you can run a terminal and Star Raiders at the
same time! So, with $729 in hand (sigh, only $400 today...) I went down to
the handy-dandy post office, and picked up my computer. But for a long time,

I looked for terminal programs without any luck. I mean, we all know how incredible Atari's terminal program is. (I ripped the chips out of that cartridge to make it into another game for someone)

Ah, but then I received my first APX (Atari-Program-Exchange) catalog. In it was a little add for a terminal program called "Chameleon". (which, I believe, HAS been mentioned before, but the requests for termcaps never seem to stop) And so, with considerably less than $700 in hand, I bought it.

In summary, Chameleon is a superb product. It features an 80 column screen (with 40 displayable columns, you scroll across with Start and shift-Start), and multiple pages preserved in memory, which can be scrolled in the vertical direction. But the most important feature of Chameleon is (da-da-da-daaaa) Terminal Emulation. With it, your atari can be either a Adm-3a (which isn't so hot) or a Vt-52 (which is hotter).

And so, no more termcap entries. Just "set term=vt52" and you're all set.

Sorry this message had to be so long, but I want to get some life back into this apparently sagging newsgroup

John Irwin
{burdvax, allegra}!psuvax!jdi

PS: Just out of curiosity, what happens to all those poor people who bought the 1200, now that the 14XX's are coming out?
PPS: Don't send mail in response to this article, post it!

I've seen two new low costs for the Atari 400 and 800 this weekend.
The 800 was 148.88 (248.88-100rebate from Atari). And the 400
was $38.88 (88.88-50 rebate) which I bought. These prices are
posted at Computer and Games, Reading, Pennsylvania.

I read that Atari will continue to make the interface module until demand dries up. Their new line of computers will have it built in. There are printers and modems on the market I presume that don't need the interface. How do these compare to the Atari peripherals? What is the general impression of the quality of the Atari peripherals?

Well, it has been several weeks since I posted my request regarding hard disks, C compilers and better DOSs for the 800, and I've received a whopping 3 replies. Here is the summary:

HARD DISKS:
It seems that Corvus may have a hard disk which connects to the 800, however, speed was unknown. If it goes through the standard Atari cable external to the 800 (not via an interface board inside the box), then it will be disgustingly slow (that external cable is a 19.2KBaud serial link, fine for a printer/modem, but not for disk).

C COMPILERS:
OSS (Optimized System Software) apparently seems to have a pretty good C compiler. It was also rumored that Aztec C has come out with a version for the Atari which is Version 7 compatable. APX (The Atari Program Exchange) has their Deep Blue C, but it is a tiny-C implementation.

OPERATING SYSTEMS:
OSS (see C compilers above) has their OS/A+ which is similar to the Atari DOS but with a command processor as opposed to the annoying menu presented by the Atari DUP. OSS apparently wrote the original Atari Basic and DOS.

If anyone who didn't reply to my original request has information, or did but somehow it didn't get to me, please feel free to post your information or mail to me (reg@vaxine.UUCP).

To those who did reply, thank you for your time.

Need ^HELP^...I use my 800 with cassette and an mx80 printer as a text processor of sorts. I can write letters and do a little editing with a fairly short program -- 50 instructions, more or less (not counting remarks). The program listing goes on and off the cassette reliably, but when I try to save a copy of the text, I get a failure. The failure is usually toward the end of the readback process, either 138- or 143- type failures.
.....Using the Poole book as a guide, and trying to code as the mailing list example is done, has not worked 100 per cent. I ^HAVE^ been able to store a short string on cassette and retrieve it, but when i try the same code on a string that's a page long, I find the error message waiting for me instead of the text I want. Whatsa matter?
.......It would help a lot if I knew how to make the 800 accept this stuff even if there is one or two errors in the I/O process, but it seems determined to give me perfection...or NOTHING! How can I shut off the checking routines? Or at least make them branch back to accept the blocks ..that it ^CAN^ read? John Cocker....mail to:..hou2b!5134jtc...

I would be interested in knowing the opinions of people that are using the following languages or products for the atari:

- Datasoft Interlisp
- C/65 from OSS
- Deep Blue C Compiler from APX
- Datasoft Basic compiler

Opinions, gripes, handy tips, etc would be welcome and would eventually be posted.

Also:
  * Is there an implimentation of Prolog for the Atari?
  * Does Datasoft Interlisp need a 128k RAM card to do anything worthwhile?
  * Or are the 128K RAM cards compatible with Datasoft Interlisp? (I've heard
      rumors to the effect that not everything works with these bank
      switchers. Any info would be helpful.)
  * Are the 128K RAM cards compatible with an 80 column BIT3 card?

So all you people out there with some of this stuff should have some
opinion on whether it works(!) or doesn't or whether it has limitations or
whether its the best thing you've ever seen, etc. I recently got the
Chameleon Terminal Emulator from APX and can testify to a similar
liking for it that J.Irwin (psuvax) has for it(but I'll save this story
for some other time).

Atari has a new 850 manual called "850 Technical User Notes" available
for the proce of a phone call to there toll freee #. (In any of there lit-
erature). Tell them you purchased it recently (they don't ask for receipt
or anything over the phone) and be prepared to give them your 850 serial
number. Delivery via last class mail took about 6 weeks for mine.

Included are schematics, and some excellent programming examples.

I have a tape problem on my Atari (surprise surprise!) that I thought might
have been encountered by somebody. I have a fairly long Basic program CSAVE'd
on a cassette (around 100 units by 410 counter) and foolishly only made that
single copy. Yep, you guessed it, it won't CLOAD, seems to be a bad spot on
the tape - it always fails with a checksum error (143) at the same place,
around 75 on 410 counter. Now, is there any way I can load the (good) first
3/4 of the tape from Basic? I've managed to do a low-level copy of the first
part onto another tape, and it CLOADs, but dies when trying to go back into

Basic (seems to wipe out program or pointers to it). I know that CLOAD format has all kinds of grundgy tables and things in addition to the tokenized program, and these would reflect the full program, so they will probably screw up Basic when it finds a premature EOF. Am I beat?

Preferably mail responses to decvax!utzoo!utcsrgv!newman, we don't get net.micro.atari. ADVthanksANCE.

Has anybody tried to use a regular terminal on one of the RS-232 ports that
come in the 850 com unit? Is there a special trick to it?

I have connected a standard terminal to the ATARI 850 - it was straight
forward, connect the data receive and transmit and ground to the right
pins on the terminal and go. Some terminals may need a "data set ready"
signal to unlock them.

Has anyone whipped up a cable from the CoCo mouse to the
Atari controller ports? Judging from the resolution discussions
in net.micro, looks like CoCo users should have gone with
Atari.

   I beleive that I asked this question some time ago, but received no response.
I'll try again, in case anybody has learned anything since then...
   For the last several months, a computer dealer in Toronto has been claiming
that Atari will soon be coming out with a new modem. It is supposed to connect
directly to both the telephone lines, and the peripheral port of an 800
(thus eliminating the need for the 850, which I still don't want to buy
at their price). It is also supposed to be switchable 300/1200 baud,
with autodial, and possibly auto-answer. The price that I was quoted was
"around $400 CDN", which would be a fantastically low price for
the described goods.
   The description the dealer gave me is backed up by pictures in two
different brochures of Atari's, displaying hardware soon to be available.
(the cover of the modem was different in each brochure) However, the claim
that the 850 won't be required wasn't mentioned in the brochures. Furthermore,

a third brochure was put out a while ago (about 2 months ago, between the other two) saying that the modem would only have 300 baud. What's going on!?!
   If anybody out in the net has any more reliable news of atari's new modem, would they please post it? I'm told that it should be available in "about a month", although that's exactly what they told me three months ago.
If I find out anything more definite, I'll let you know.
   Thanks!
-Kieran A. Carroll

I saw an Atari product brochure just the other day when I was also searching for a modem. There is a new model, the 1010 I think, that is direct connect, 300/1200 baud rate and is supposed to be available this fall.

Sorry about that....I tried to temporarily suspend my article about the Atari modems and the damn program posted it. Damn program.

Anyway, the 835 direct connect modem was originally listed as 300/1200 baud, but more recently was listed simply as 300 baud. I think Atari got cold feet about the 1200 baud option.

There's now even some question as to whether the 835 is going to be introduced at all, since some of the new XL computers are supposed to have built-in modems. If anybody has additional information about this, please post.

I am currently using a Microbits modem which connects directly to the joystick port on the Atari, and now works ok after some aggravating problems with telephone compatibility (which I posted about a while back). It is, of course, 300 baud, but it cost $200 which is a reasonable price I guess.

According to all the sales literature I have seen (and first hand look at new products at Consumer Electronics Show in June), the new Atari 1030 direct connect modem does not need any interface unit. It plugs directly into your telephone jack and your serial jack on the Atari computers. In fact, it is nearly the same (except for looks) as the present 835 direct connect modem. The big difference is that the 1030 has built-in modemlink telecommunications software. It is also compatible with their Telelink I and II. Although it was designed to be compatible with the 600XL and 800XL, I am certain it will also work with the 400 and 800 computers. The 1400XL and 1450XLD have built-in modems, so they aren't needed there. I don't know what the price will be, but I know the 835 isn't cheap because it is sold in a package (Communicator II) with the telelink II cartridge.

Hope this helps...

Kit Kimes
Western Electric Co.
Montgomery Works
Aurora, Il. 60507
..!ihnp4!we13!mgweed!kek

P.S. Both the 835 and the 1030 Modems are strictly 300 baud units.

The "Centronics Standard Interface" refers to the connector and signals
sent to the printer and expected from the printer; in the case of the
connector it specifies only the PRINTER end of the cable, and not the
computer end of the printer cable.

The printer cable is expected to be 12 pair cable, each pair twisted,
and can be shielded overall to reduce interference with radio/tv.

The connector on the printer end is an Amphenol #57-40360 36pin male
connector with hood.

The signals and pinouts are as follows:

Signal pin	Ground pin	Signal name	Remarks
1	19	Data Strobe/	paired with ground
2	20	data bit 0	ditto
3	21	data bit 1	ditto
4	22	data bit 2	ditto
5	23	data bit 3	ditto
6	24	data bit 4	ditto
7	25	data bit 5	ditto
8	26	data bit 6	ditto
9	27	data bit 7	ditto
10	28	Acknowledge/	ditto
11	29	Busy	ditto
12		Paper Out	paired with 13
13		Printer On Line	paired with 12
	17	Chassis Ground (cable shield)	

How it works:
   (All signals are TTL levels; high refers to ttl high output voltage, 2.4 volts minimum; low is TTL low, less than .8 volt. Printer represents one standard TTL load maximum.)

   The data is placed on the parallel data lines pins 2 thru 9, then at least 500 nS later, the STROBE/ line (normally high) is taken low for at least .5 uS, and for no longer than 500 uS. 500nS later the data may change if desired.

Within 2 uS the BUSY line will go high if the operation requested causes the printer to become busy. After the printer completes whatever operation was requested (printing, paper movement, etc) the BUSY line will return to its low state.

A low pulse on the ACKNOWEDGE/ (normally high) line will then occur. At this point the sequence can be started over again to send the next character or command.

If the printer runs out of paper, or is taken off-line, the BUSY line will go high, and the appropriate line (PAPER OUT or ON LINE) will indicate the status. Most computer systems check these after the BUSY line has been continuously high for 1 second or more, and print a message telling the operator to correct the printer fault.

Taken from centronics document "Technical Manual for Model 101A Printer" Appendix B, July 1975.

(A note: in many cases, the driving microcomputer is slow enough that it is only necessary to check the BUSY line, and the ACK/ signal may be ignored.)

If anyone with an ATARI 400 or 800 computer has used a TI Silent
700 type paper printing terminal (300 baud) as a printer via the
ATARI 850 interface module, I would appreciate receiving cabling
and computer program details by mail. I do not have a disc drive
but do have the cassette tape and both the AMODEM program and the
CHAMELEON CRT emulator programs. My TI is the Model 745.

I have just acquired an Atari 400, and have nothing else.

I am soliciting advice about whether I should (pick one):
1) Buy an Atari 410 cassette recorder now, or
2) Buy an Atari 1010 recorder.

The attractive feature about the 410 is that I can buy it and an
(essential) Basic cartridge for $109, as a Programmer Kit.

My real question concerns the relative advantages and disadvantages
of the two recorders and your estimate of the monetary value
of those differences.

Thanks,
Mars Gralia

Now that Alan Alda is starting to advertise the new Atari line, does

this mean that the new computers are available? Has anyone heard
if the 600XL is shipping yet? How about the other new computers?
I am particularily interested in knowing if there is any word on when
the 1450XLD will be available. How about DOS III?

Thanks,

Does anyone possess and have knowledge about the :

BIT 3 80 column board

or the

Franklin 80 column board?
I'm looking at buying one of these but don't know which one.
I am trying to find out if these boards are compatible with some of the
existing sw :

APX Pascal,
APX Deep Blue C,
any of the OSS C, Assembler products,
any editors,
or word processors.

(Also it would be nice to know why you bought one over the other)

Any help would be appreciated,
c.ditzel

Seems to me that with an ATARI 400 and an 850 interface, one could
use the keyboard of a TI silent 700 type terminal as a substitute
for the 400's membrane keyboard. I would appreciate receiving
cabling and program details by mail if anyone has already done this.

Interesting info regarding the use of PERCOM double
sided drives and OS/A +...

When using the PERCOM double sided/double density drives

with OS/A+ I noticed some discrepancies in the formatting.
Upon getting nowhere with PERCOM (Flame dept.....They have NO
interest in supplying technical info to users), I solicited
help from OSS.

End result---a bug in the PERCOM firmware was explained! It turns
out that when using PERCOMs in double sided mode
the last sector is always lost! In addition, they format the last
three sectors (Mirroring the first three) in single density format
when using double density. Hence in double sided mode, you lose either
1 or 4 sectors depending on density.

OS/A+ V4.1 corrected for the PERCOM bug by masking off the last 4 sectors
in the VTOC after formatting. Only when confronted by this info from OSS
did the techies at PERCOM 'fess up!.

They admitted to a replacement ROM to fix their bug being available for a
nominal charge (I still don't see why I have to pay to fix THEIR bug?!)

OSS also stated that release 4.2 of OS/A+ will soon be available for a $10.00
update fee...which I sent and am waiting for..In addition to correcting
minor bugs, an enhancement to use 810's which I requested of Bill Wilkinson
last year is being incorporated.

I have only kind words to say for OSS and all their products....not so
nice things to say for PERCOM! For a company to only admit to a bug
in their hardware under duress, and try to sluff it off on the
software, especially when they KNOW it's their fault is unconscionable!
They wasted more of MY time than was necessary.

This came over the arpanet. If there is any interest from any of you out there, let me know, and I will forward the information, unless you can make contact yourself (i.e. you have arpanet connections).

Glenn Reid (..seismo!uwvax!reid)

From: Norder.WBST@PARC-MAXC.ARPA
Subject: Okidata Printer "Buy"

Are you interested in a group purchase of Okidata Microline92 printers?

A local vendor is willing to consider offering a special purchase price, even lower than his normal price of $ 465 + tax for the parallel (centronics) version. (The $ 465 price is already the lowest that I have ever seen in the mags or in "Computer Shoper"!) My guess is that the group price will be around $ 440 -
 $ 450.

The Okidata 92 was one of the top 2 dot matrix printers in this month's "Consumer Reports". It is a bi-directional, logic-seeking, multi-font printer which operates at 160 cps, 80 cps (for enhanced mode) and 40 cps (for multi-pass, correspondence quality mode). At 40 cps, print quality is amazingly good, "near-letter quality". Max paper size is 8.5-9", but it can print in compressed mode at 136 characters/8.5 inches. Friction feed and 9.5"-wide pin feed are standard, with tractor feed (3-9.5" range) optional at only ~ $ 50 list. It is equipped wth a parallel (Centronics-type) interface. (Serial versions are available, but at + ~ $ 50 list, but I want to limit this buy to parallel printers only.) Atari owners can drive centronics from joystick ports 3 & 4 using a handler sold by Elcomp for about $ 20. Commodore fans will require some kind of interface as well. Other computers, I am not sure.

If you are SERIOUSLY interested, please message back.

Regards---Paul

I'm looking for information on the new Atari joystick described in the fall 83 Atari Connection magazine (pg 42). Specifically I would like to find out what frequency the transmitter using, and also what is the format of the data sent between the joystick transmitter and the receiver (which plugs into your controller port).

Thanks for any info,

I expect to get a disk drive in the next month some time, and I don't know if it is worth my time to develop programs on cassette in the meantime. Can someone tell me if you can load something from cassette then write it to disk with the Atari? (Specifically with the ACTION cartridge) I can't find any mention of this anywhere, and it seems as though you can't do it, although you certainly should be able to....

Thanks, everybody.

I have just sent away to a company called "Don't Ask Software", for a voice-synthesis program called S.A.M., or "Software Automatic Mouth". According to the company's brochure, the program has a lot of nice features, including direct phoneme control, and pitch and stress control of the voe. What I'd like to know from y'all is, has anybody out there had any experience, good, bad or indifferent, with this program (or with the company, for that matter)? Please mail replies directly to me; I'll summarize anything interesting for the net etc. etc.

Thanks!

After having called suppliers all over the United States,
I just bought the 850 interface at a local Sears store
by the skin of my teeth (200 bucks + tax!).

According to the buyer from Stereo Discounters,
Baltimore, Md., Atari will no longer supply the 850
interface as a single sale item. You must now buy the
Atari Communicator Kit (850,modem,telelink II).
Computer Mail Order West will only supply 850's with
an order for a printer or modem (Atari of course).

By the way, I already had a nonAtari modem, and would
still like to buy a nonAtari printer!

As far as I'm concerned, Atari has just taken another
step backwards.

A while ago, I asked people in this newsgroup with experience with a

piece of software called the "Software Automatic Mouth", from Don't Ask Software (in Sunnyvale, I think) to give me their evaluation of it. I received about half-a-dozen responses; the concensus is that the program produces very high-quality speech (better than a votrax, according to two of the respondents), but that it has one large drawback. That is, in order to keep the DMA for the screen refreshes from interrupting the voice during speech, the display is turned off during speech. This eliminates a number of potential applications for the voice, such as game sound-effects, and speaking words as they appear on the screen. Too bad, but that's the way the computer is built...

I'm quite pleased to receive all this reassuring mail, especially since I'd already sent away for the program, before sending my query to the net! Thanks for your responses, people.

Zaxxon is finaly out, but on tape only. Has anybody seen the disk version? Also, I would be willing to buy the tape if could put it on disk. Has anybody out there done this yet?

Received: Fri Apr 15 08:31:32 1983

Several days ago I received Zaxxon for the Atari computers. On the whole it is done extremely well especially considering that it only needs 16K of memory to run. There are a few substantial differences between the arcade and the computer versions. The ship you are controlling does not change size with altitude as you fly it through the fortress. When it is out in space there is no control over altitude at all. The lack of altitude control in space was probably done to make the game more playable since one cannot judge the altitude of the enemy planes due to the lack of size change. There are a couple of other quirks;although the instructions claim XXX number of points for hitting a missle ther are no missle launchers on the playfield. Also the instructions claim that hitting the escape key will pause the game which does not work.

After conferring with the company that sold me the game they told me that the disk version of the game will have missle launchers and pause capability. In addition it will be able to store highest scores. These are the only differences they are aware of at the moment. The disk version should be available in about 6 weeks.

On a scale of one through 10 I'd give Zaxxon an 8. The best game I've seen for the computers is Protector II. It is an extremely playable and challenging game and is far superior to the original Protector. Yes, I have played Choplifter and Protector II in my opinion is better.

I would like to collect information on 48K memory boards for the Atari 400. If you have first-hand experience with one (e.g. own one and have used it enough to know how well it works) please mail me your comments on how well the board works, quality of parts, manufacturer, and price and if there is sufficient response, I will post a summary. If you obtained a bare board and built it yourself, your comments would also be of interest. I fit in the latter category - I got a 48K/52K bare board from Tiny Tek in Texas, built it carefully using mil-spec components, and it didn't work properly at all. It is now somewhere between here and Texas. Apparently the 400 is very sensitive to the brand of 64K dram you use, with their board anyway. I've seen boards in local stores from a Canadian company, Inhome Software, that seem to work fine. Thnx in advnx.

Subject: improving the ATARI 410
X-Google-Info: Converted from the original B-News header
Posted: Fri Apr 15 09:18:12 1983
Received: Sun Apr 17 04:09:15 1983

Antic has an article on how to improve the performance
of the Atari 410 program recorder. But there are some
mistakes in the article. It should be as follows:

R113--------5.6K 1/4W 1%
R111--------7.5K 1/4W 1%
R112---------56K 1/4W 1%
R109---------68K 1/4W 1%
R114--------240K 1/2W 1%
R101--------330K 1/4W 1%
R110--------330K 1/4W 1%

This is actually all that has to be done. I think
Atari has had 3 different companies make the 410, so
while the values are the same the RXXX number may be

different. Also, some people say that they found
some of the resistors to be off by as much as 20%,
its a wonder any tapes work at all.

I bought the cassette Zaxxon for the Atari - I also did not
see a disk version, and when I asked about it, the salesman
told me that the reason the disk wasn't available was that
the disk version was going to be a larger, more complex one
and wasn't ready yet. The cassette version is very good, but
does seem simpler in some respects than the Colecovision
game. Anyone know more? With regard to copying cassette boot
tapes to either tape or disk, there was a great program to
do that published in the Feb/Mar Antic, called "CBOOTMGR".
They said it was only good for copying single-stage boot
tapes, but I have found it works fine on multi-stage boots;
it just then becomes a multi-stage process. I have rewritten
the cassette read portion of this program entirely in machine
code and use it to read in and disassemble any boot tape
with the Editor/Assembler cartridge.

  Good news for ATARI owners with PERCOM AT-88 disk
drives. If your disk drive is still in warranty you
can call PERCOM and they will send you a free Data-
Separator board. The phone number I called then at
was 214-340-7081 and I asked to talk to Customer
Service. They sent the board out about a week later
C.O.D. for shipping charges only (about $3.00).
  Also I found the "pot" used to control the disk
speed. It is a blue trimpot on the very small board
behind the drive mechanism. Some people reccomend that

you turn the drive speed down to about 291-292.

I know very little about the Atari home computers but have the chance
to get one cheap. I would like to know whether the serial port that
it has can be easily configured so that one can hook up a terminal to
it. Also with the serial line is it easy to download stuff; what about
a modem connection to the serial line? I have seen a advertisement where
they hang a disk drive, printer and something else off a black box
(their serial interface I assume) which is connected to the serial line.
Would this interface be required if I only want to hook up one item,
say the terminal?
                    thanks, Brad Hemminger

I'm sorry that the first version of this article got smashed.
Here is what it should say:

If you are reading Leo Brodie's book, Starting FORTH, and ValFORTH, then you are faced with a mild but basic incompatibility problem. Anybody out there using figFORTH or its derivatives should take heed, also.

In Brodie's book he creates variables by saying:

                VARIABLE <variable name>

I believe that it automatically provides an initial value of zero. In figFORTH, however, the variable takes its initial value from the stack. Thus the declaration would be:

          <initial value> VARIABLE <variable name>

A much nastier incompatibility between Brodie FORTH and figFORTH is their treatments of the tick (') function. Brodie's tick produces the code field address (CFA) directly; therefore, it is possible to EXECUTE a 'ed name:

```
' VLIST EXECUTE
```

is exactly equivalent to typing VLIST. In figFORTH, however, the tick function returns the PFA from which it is possible to calculate the CFA by either subtracting 2 or saying CFA. In figFORTH the sentence should read:

```
' VLIST CFA EXECUTE
```

or:

```
' VLIST 2 - EXECUTE
```

Failure to include the CFA or 2 - will result in a crash.

I don't know of any other major inconsistencies between the two versions. That latter one is mean enough in that it prevents you from sitting down at your computer and typing in examples from the book.

For those of you that are into FORTH, here is a warning:

> EVERY VERSION OF FORTH FOR THE ATARI THAT I HAVE CHECKED SO FAR HAS A BUG IN IT THAT WILL CAUSE ABOUT .4% OF ALL DEFINITIONS TO CRASH.

The explanation is involved, so I won't go into it on the net unless there is considerable interest. If you care, please write to me.

I hope you find these comments of interest.

Query: Has anyone out there heard anything about the new atari direct-connect
modem? The information I have says that it is switchable 300/1200 baud,
and intimates that it may have auto-dial ability. The price that I was quoted
was $400 canadian. Has anybody bought one of these? Are there any reviews
on its performance? Does anybody know if it steals much processor time
while operating? Note: this modem shouldn't require the 850 interface,
as far as I can tell.

Given an ATARI 800 with printer, with basic cartridge, and with
cassette (but without disk).....is it possible to enter ordinary
text, to do simple screen editing, and to print the entered text?
I've tried and failed completely. BASIC demands proper format, and
that means (I think) that, other than commands, all else has to be
labeled as DATA or REMARK. Maybe a few other things like that, but
all with some kind of label-per-line. That makes the text
business tedious. I suppose that a smart printer (my MX80?) might
be able to strip off the first few characters of every line, but I
haven't looked into that possibility because the file would be a
pain to create in the first place if i have to type REM at the
beginning of every line. I guess buying a disk would give me what
I want, or would I have to buy the word processor software too? For
simple typing, that seems like overkill.

From: Marshall Abrams <abrams@mitre>
Subject: Running a Load file from BASIC
To: info-atari@su-score
Cc: abrams@mitre

In answer to my question, Jeff Goldberg, the author (I think) of the ABC
compiler, has provided me with a way to load a Load file from BASIC. By a Load
file I mean a file loaded from the DOS menu with the L command.

In either immediate mode or from a program execute the following:
     OPEN #1,4,0,"D:FILE.EXT"
     X=USR(5576)
The IOCB must be number one, because this jumps right into the load code in
DUP. If you have the listing of DUP this is obvious (once you see it).

I've never seen reference to this technique before. Of course, if you're using
the BASIC cartridge you can't load a file which uses the top 8K of memory.

I'd be interested in comments and experiences and will forward them back
to the group.

     It seems that production on 400's and 800's has already ceased. It is now also rumored that production on 1200's will cease shortly; no confirmation is available yet.

     The 1200, despite its short product life, sold quite well. About half of the people who bought it did so thinking that it was a 64K machine (as the box stated) meaning that a user had 16K more RAM in Basic than on an 800. Needless to say those people are quite upset now.

     There is an Atari internal memo describing a possible fix to the video overdrive problem on 1200's (especially when using monitors), but it's been rumored that the "fix" makes the problem worse. Since nobody has schematics for the 1200 yet, nobody is willing to undertake fixing it themselves.

     If you have a 1200 that is still in warranty and want an ECO to fix the video overdrive problem before the warranty runs out, give Atari a call NOW. You ought to be able to arrange for an extension of your warranty or some other arrangement so that you will get that ECO for free even if you're out of warranty.

     I spoke with John Bernal who is one of the individuals at Atari responsible for 1200 customer support. He seemed warm to the idea of offering 1200 customers an upgrade to the 1400 (1450 is out of the question because of the built-in disk drive) at a reasonable price. Atari does seem to be concerned with losing credibility because of the 1200 (as well it should!). A 1200 to 1400 upgrade (whether trade-in or ECO) costing $300 or so ought to be profitable to Atari and do much to smooth over a lot of the bad customer feeling.

     If you have a 1200 and want a reasonably-priced upgrade, write Atari at their Sunnyvale address directed to the attention of John Bernal. He told me he will be meeting with the president of the organization in July and it would help a lot if he could show a set of customer letters asking for a 1200 to 1400 upgrade.

#N:harpo:25900001:000:792
harpo!bob   Jun 3 11:10:00 1983

My Atari 800 has developed a problem. It is used with a TV as opposed to
a monitor , and the problem exists when all peripherals are disconnected
and unplugged. Bars of video distortion and noise (horizontal) drift slowly
thru the screen at a steady rate. The bars (only one at a time) occupy
about 1/5 of the screen, and the remainder of the screen looks less sharp
than usual. Inserting and removing a program ROM a few times seems
to clear up the problem, but
the next time the computer is turned on, it is likely to be back. Looks like
an interference problem to me , as I get the same results on another tv.
Is my modulator dying? Bad grounding somewhere? Has anyone else encountered
a similar problem?

     My Atari 800 (about 9 months old) has a problem which I
don't recall noticing when I first brought it home. On the left
side of the TV screen there are light vertical bars about 1/4"
wide.   They're there no matter what is or isn't connected to the
computer. I also get slanted lines migrating across the entire
screen.   They seem to respond to my jiggling the power cord or
changing its position, but they don't go away.

I have heard of others with the same trouble, a wavy line walking up the screen, so I'll broadcast an answer. The problem seems to be a "retrace snake". This would be caused if the ATARI were superimposing 60Hz onto the video signal. You might note that the frequency exhibited by the "snake" is that of the difference between 60Hz line frequency and the vertical refresh rate which is quite close.

Look for any source of 60Hz. Bad grounding is certainly a candidate; but, the most likely culprit is something gone bad in the ATARI's power supply. If you have access to the appropriate tools, check for either a bad rectifier, a bad filter cap, or a bad regulator. If you're lucky, there is even the possibility that the problem is as simple as the end of the video cable that is plugged in INSIDE the case has partially worked loose and needs only to be reseated.

Please let me know how you make out.

Advantage of dumb keyboard.

The following may not be completely correct but I will
try to explain how Atari uses a dumb keyboard to give
it a big advantage over other types.

On the Atari the keyboard does not produce the ASCII code,
rather it is just a matrix of switches. The symbols are
generated by the GTIA/ANTIC chips with the use of a character
table located in ROM. This table is indexed into by the value of
the switch added to the contents of the memory location pointed
to by the Character base address register. This means by changing the
value of the character base address register to point to RAM and then
loading in your own Character set you can have any thing you want
generated on the screen or be sent to a host.

In other words a completely redefinable character set to meet any
particular system or use. Also if you don't like the keyboard or
the placement of any key, you can buy the keyboard you like and
wire it in at very low cost ($10 to $30). Or put tape over the original
keyboard.

One of the terminal emulator programs for the atari does a real
good job of emulating an VT-52 or ADM3a, and was written by the
author to work well with UN*X. You can actually play rogue, or
use EMACS or VI.

I have an Atari 800 with 48K, one Percom double density disk drive, and 2 Atari single density drives. I want to know if anyone out there in net land has heard of any serious system development software for the Atari. Specifically, I am looking for:

- a >good< C compiler (not one of the tiny Cs floating around),
- a better DOS (possibly allowing sub-directories and a hierarchy, though I don't hold out much hope for this),
- a good screen editor. The screen editor that comes with the Atari Macro Assembler isn't too bad, but...

Also, has anyone heard of a hard disk available for the 800? I suspect that there is one lying around somewhere, but haven't heard of it.

Many thanks in advance, and if there is sufficient interest I'll post a summary of what I hear/read.

My Atari 800 has a strange, and seemingly transient, problem.

Sometimes (nearly always) the TV screen suddenly becomes filled with interference--a screen-wide stripe of fuzzy-looking stuff which makes the display under the stripe hard to read. The condition usually becomes progressively worse, but I can stop it temporarily by opening/closing the cartridge compartment door a few times (booting the system repeatedly).

This is a very disturbing problem, but happily it is the only one that I have had with my system. Does someone out there know what is going on?

I'm posting this item for a co-worker -- any replies
should go to him at whuxj!abm, not to me.

****

Subject: ATARI 800 TRANSIENTS

I also have an Atari 800, and experience a different
transient problem. Occasionally the TV picture begins to
get fuzzy and break up, but I cure it quickly by changing
the TV channel off Channel 2, then back. This indicates
a problem with the TV, rather than with the Atari, yet it
never happens while I watch TV. I have never had the screen-wide
stripe of fuzz described by Mark Young.

However, I have had a much worse problem with my Atari, and
would like advice if anyone knows what's wrong. Occasionally
for no apparent reason--usually after I have been writing
a program for 4 hours!--the d**m machine suddenly refuses to
respond to the keyboard. The cursor sits there, refusing to
move or make a sound when you hit any key. Thus, I can't save
the program. I can't even list it to see what I've done! I suspect
the problem is related to typing too fast, or hitting a particular
combination of keys. Could it be a bug in the operating system?

This problem is VERY rare. Otherwise, I'm quite satisfied with
the Atari 800, especially its graphics, though I confess it's
not easy for an amateur like me to unravel all the mysteries
of color registers in various graphic modes. I especially like
having the ability to invoke up to four different voices at once.
Does anyone know how to get anything but square waves out of an
Atari? I'd like to use wave forms of my own design...

Andy Myers

Andy Myers problem with system lockup is most likely
one of two problems:

1) Accidentally hit CNTL-1. This would cause a temporary end to screen
display until it was toggled again. (Similar to CNTL-S on UNIX).

2) Overheating. This can be prevented by proper ventilation, or
replacing the old 16K RAM cards with a newer 48K card that uses less
power/heat.

Either hitting system-reset, or using a product like OMNIMON as a replacement
operating system should help in the former. In the case of the latter,
I guess the only choice is to keep it cool.

Adding to the list of Rob Botwin:

3) There is an operating system bug called
"page six lockup" (I think).

It goes like this: If you make too many
edits during the writting of a program, the
system will lock up.

Solution: Resave your program about every
20-24 edits. Some back issues of Compute or
A.N.A.L.O.G. magazine describe this
infamous but common problem.

I am looking for a program that allows up/downloading
from an Atari 800 to UN*X (including binary code, if possible).
Either commercial or public domain software is acceptable.
Any suggestions appreciated.

Does anyone have a termcap for an Atari 800 without an 80 column board.
I just got access to a modem, am going on jury duty in a few weeks,
and would like to be able to log in at home on a crt.

Thanks,

I am submitting this message since this is a service that most atari owners may be interested in and not be aware of.

There is a company that will digitize photo's for atari owners.

By digitize, I mean they will scan in the photo's so that you can see them on your TV screen.

For $20.00 they digitize two photo's and send them back along with a floppy disk. The floppy disk contains a fairly nice paint program (copyrighted but not copy protected), a basic program to use as an example for loading the pictures, and the digitized pictures. A few example pictures are also included on the disk. The digitized pictures come out in black & white (16 gray scales) (They can digitize color pictures but they come out in b&w).

Additional pictures are digitized for $6.00 each. The pictures are digitized in Graphics 9 so make sure you have a GTIA chip before sending them any money. The results are fairly impressive, digitized faces come out real good.

If you send them "high detail" type pictures (such as text, etc) and a note, you can get it digitized in Graphics 8 but the number of gray scales is very limited in Graphics 8 so black-white pictures are best (company logo's, etc). Also, the paint program only runs in Graphics 9, 10 & 11 so any pictures done in Graphics 8 cannot be manipulated with the paint program.

The disk auto boots and is menu driven so using the software is easy. The paint program is very extensive and includes commands such as line, rectangle, circle (any size), flood (floods an arbitrary closed polygon), color mix (for graphics 10), pick, put, load and save.

Regarding my previous requests for Atari info:

Apparently any mail sent to me over the last few days (weeks?) was munched and swallowed by the linus machine. I have been informed that this problem is now fixed and request that any responses to my information request (hard disk, systems software, etc. for the Atari 800) be re-mailed to me.

Both the people at linus and I appreciate your patience.

The listing for DUP is available from your friendly neighborhood
computer store for about $7 to $10 (I forget the real "list" price).

It is listed in the APX catalog.

While not quite as interesting as Wilkenson's ramblings in "Inside ATARI DOS,"
it is a handy reference to have.

I have some game draw and collision routines for the
apple, which i know pretty well, that i would like to
port to the atari 800, about which i know very little.

Could someone tell me:

    1: does the atari 800 have an RIFA (Reduced
    Interference From Antic) mode that allows one
    to do normal bit-mapped draws by just moving
    bytes around in memory?

    2: what is the best way to use this chip anyhow?

and a related question

    1: does anyone have specs and info on running
    the graphics of the STBR (Soon To Be Released)
    atari machine?

All information incredibly appreciated.

I would appreciate any information concerning methods
of connecting a standard cassette recorder to an Atari 400
rather than the Atari recorder.

The cartridges used by the Atari 400/800 contain two 4K-byte PROMS. Does
anyone know if they are 2332's? There are only custom Atari numbers on
the chips. Are they single or triple voltage types?

This sketch program uses paddles to sketch on the
screen. The buttons on the paddles control erasing,
filling, and the lifting of the "pen"; when the pen

is up (off the screen), the other button controls the
fill. when the "pen" is down (on the screen), the other
button will erase the screen. To change the color, retype
line 50, substituting any number between 0 and 15 for 1.

I think that there is more difference between the 2732 and 2532 than the chip enable business. The 2732 is a +5v only whereas isn't the 2532 a triple voltage (+5, +12/-12?) part? Also I believe the new Defender cartridge is a 16K cartridge. There are 14 lines to the edge connector rather than the standard 13, and the chips say 9364 on them among the other custom Atari numbers, suggesting they're 8K bytes each. There is also a second bypass cap on the board. It's a great cartridge, for those who haven't seen it, but it's extremely difficult to last more than 10 minutes.
Anyway, aside from EPROMs, does anyone know what the ROMs are in the 400/800 cartridges? I'd like to read them.

I have heard that the atari 5200 is just a stripped down 400 with fancy controller/joysticks. I looked at one in the store the other day and it looks like the internals of the cartridges are approx. the same. If I buy a 5200 cartidge, remove it from that big hunk of plastic, will it fit into my Atari 800? Are the pins compatible?

While inputing a program out of a magazine (Antic),
I came across the following:

300 ? "}":some other instructions,etc,etc

Question: How do I get the Squiggly bracket?

I am more confused if they really want to print it

do to the location of the print in the program.

However, my hunch is that it stands for some other function.

Am I right or wrong?

P.S. I have a standard 16k 400.

thanks

The ROMs used in the atari 400/800 cartridges are two 4732 with
the not ce for both chip selects.

The 2532 is a single 5 volt supply eprom which is plug in compatible
with the 4732. TI is one supplier of these chips the TMS4732,TMS2532.

The problem is that the Atari (like the Pet, Apple and far too many others)
uses the 6502, by far the most primitive of the widely-used microprocessors
in terms of architecture and instruction set. It *cannot* support a native
C compiler, and the code density coming out of even the best cross-compilers
is bound to be poor. There are NO 16-bit registers, the stack is 8 bits wide
and is fixed-size (256 bytes) and at a fixed location (page 1 in memory).
The only effective way of implementing a high-level language is to write an
intermediate-code interpreter (the approach taken by the USCD p-system) or
put in a supplementary processor (such as the Z-80 or (better yet, from a
high-level language implementer's point of view) a 6809). To the best of
my knowledge, none of the above are available for anything except the Apple.
There are alternatives, however; Forth is almost certainly available, if only
because it's so easy to port; Atari Basic is supposed to be reasonable for
really simple applications; 6502 Assembler sucks, but the 6502 is a fast
processor and writing in assembler lets you take advantage of that speed.
My suggestion : buy a second system, like the IBM PC, with a decent processor
and tons of good software. If you're in no rush for quality software, anything
based on the 68000 is going to be more powerful that the IBM PC with its 8088.
However, if you're really patient the 16000's will be out soon, and should be
strong contenders.

--Bernie Roehl
...decvax!utzoo!watmath!watarts!bernie

P.S. There is a Tiny-C *interpreter* for the 6502, but it is extremely slow
and provides a truly tiny subset of a subset of the language. Good for
playing with, useless as a serious software development tool.

X-Google-Info: Converted from the original B-News header
Posted: Fri Jan 28 21:15:04 1983
Received: Fri Jan 28 21:40:25 1983

The topic of why the 6502 can't support a compiler seems to
have come up again. The standard reasons given (no 16-bit
registers, 8-bit sp) don't seem convincing to me. The 6502
intentionally traded off on-chip registers for addressing
modes. The Z80 has more registers, but the 6502 has many
more addressing modes; the 6809 has both (oversimplified).
The reason the 6502 has no 16-bit registers is that you
are supposed to use the indexed indirect and indirect
indexed modes to use page zero as a large register bank,
essentially giving you 128 16-bit pointer registers. If
you look at the instruction timings, you can access an
absolute memory location through a two-byte zero-page
pointer (register) with a one-byte offset in as few as
5 cycles. Another benefit of few registers is fast state
saving (interrupt handling has little overhead). The
shortcoming of the dumb 8-bit stack pointer would
seem to be naturally implemented in software, with a

bit of a loss in speed. Also a useful capability I believe not provided in the Z80 is the 6502's memory-to-memory instructions; you can incr/decr, shift or rotate absolute locations without using the limited registers.

As proof that the 6502 CAN support a compiler, the company below claims to have a native 6502 C compiler available (I posted this to the net some time ago - I don't know any inside details on the compiler, so don't ask me. Also I am realistic enough to realize that any time-critical operation on 8-bit processors at low clock rates is best done in assembler, so I haven't looked into the product).

Has anyone experienced some power-up quirks when using the new Defender cartridge in a 400? Mine usually works fine, but occasionally I just get a blank screen when I close the cartridge door. I am wondering if there is some problem in using 16K cartridges (I believe Defender is one) with the 400's power supply. I took in my 400 for service; they found nothing wrong with it. All my other cartridges work perfectly.

   For some time, my 800 has had the characteristic that it would
tend to crash, some time (usually about a couple of hours) after
power-up. The time before crashing has recently been decreasing;
it's rare that I can get the thing to work for an hour straight,
now (thank the gods that I have a disk drive!). I suspect that
the problem is due to a poor connection between one of the innumerable
cartridges and the bus; however, sometimes the crash will come when I'm
not touching the machine, and hence it wouldn't be due to a cartridge
shifting in its socket.
   Question: do many other people have this problem with their machines,
or is it time to bring mine in for service?
Thanks in advance.

I have had problems with the Defender cartridge also.
After playing for about 30 minutes it usually freezes up.
Also I have noticed that it runs hotter than any other
cartridge. One thing you might try is to remove the cover
on the cartridge, and cram something in the door swith so
that you can leave the door open.

My 800 crashes, too. The same symptoms, usually right after power-up. The
screen will flicker in a very uniform way (within each pixel, the same pattern
is visible when it flickers). Everything locks up, no keyboard handler, no
nothing. I believe it has something to do with corrosion on the contacts
between the Operating System and its corresponding slot, or possible with the
CPU board and its contacts. I have spent a lot of time cleaning the contacts,
but it doesn't seem to make a huge difference. After the unit has been on for
quite a while, I guess when I turn it off, it must oxidize much faster, since
invariably I have a problem when I turn it on again after letting it sit for
a while. I can usually remedy the problem by cleaning off the Operating
System contacts. Is there any way to keep this oxidization from occurring????

I'm not sure the machine itself is crashing but I'm experiencing

problems whenever I play Stellar Shuttle. (machine coded on cassette).

Seems like I can play for about an hour or so then some sort

of glitch comes along. Usually one of the men turn color, and thats

the sign that all's not well. On the next play, all hell breaks

loose and start and reset are no use.. This is the only

machine code cassette I have, however no problems with any

cartridges.. Could this be a software bug???

The reason I ask because the same problem occurs on two different

machines?????

I have not actually seen the C/65 compiler in operation, but have heard from several sources that it's a (small) subset of the language. Your observations about design tradeoffs in the 6502 architecture are valid. However,

1. Doing any kind of 16-bit operations on the 6502 is still extremely inefficient; for example, adding two 16-bit signed integers requires several instructions, whereas a processor like the Z-80 can do 16-bit signed adds with a single 1-byte instruction.
2. The stack on the 6502 is 8 bits wide and a fixed 256 bytes deep. Since you want to keep intermediate results of calculations on the stack, as well as local vars and arguments to functions, you quickly run out of stack space. The solution you suggest (a software stack) is fine, but slow and inefficient compared to a machine with a real stack.
3. The 6502 has been around a *long* time, and is widely used (apple, pet, atari...). Yet in all this time and with all the demand for good software for the chip, no one has implemented any native-code compilers for the 6502. To me, this says something about the capabilities of the chip. Even the 6800 has native-code compilers for it! (Granted, they're not very good, and produce terrible code, but at least they exist!)

The 6502 is a fast, cheap, widely used processor. It is well-suited to simple applications. It is *not* suitable for supporting high-level languages.

Here is some accumulated lore about crashes and glitches on the ATARI:

1. When you clean the contacts, clean all of the contacts! This includes CAREFULLY removing the ROMs from their sockets, GENTLY erasing oxidation from the pins, and reseating them.

2. When you use an eraser to clean off the contacts, be VERY gentle. The precious-metal coating is extremely thin; and, when that gets rubbed off you're in for a lot of oxidation problems.

3. As a rule of thumb, with gold-to-gold conections, the problem won't be oxidation... just accumulated dirt. The clean-up period for this should be on the order of months. For gold to silver there is a mild oxidation problem that could require clean-up on a one or two month basis. If it is gold-or-silver to something else, like German silver or solder, the service interval may be days or weeks depending upon ambient temperature and atmospheric contaminants; e.g., if you live near a paper mill or a rubber plant with the resulting corrosive atmosphere you have got a real problem.

4. One other bit of unpleasantness is that some alternate sources for add-in memories had a problem EXECUTING code out of high memory. It turns out that the 6502 makes adjacent accesses to memory when fetching code while it makes less frequent access to memory on data fetches. This means that a memory test that only accesses data in memory won't detect the problem. What is needed is a test that moves a piece of relocatable code through the area under test and executes it. The only problem there is that it won't pick up pattern sensitivities. Oh well! The nice part about it is that the manufacturers own up to the problem when asked, and their warranties are still in effect.

5. Still another little mystery is the misbehavior of the system if you fool around with the joystick at inopportune times; e.g. during disk accesses, etc. I'm not entirely pleased with the explanation; but, it could be an electro-magnetic interference problem. Solutions are to avoid keeping your computer in a room with nylon carpets (static build-up) or any other insulating material. Of course, as far as diddling with the joystick while accessing the disk goes, it's simply a case of: "Doctor, it hurts when I do this." ... " So, don't do this!"

Good luck with your machines.

Subject: Leaving it on....

Does anybody know what the dangers are of leaving an Atari 800 with the power on indefinitely/permanently/for long periods of time??? I have a pretty bad problem with oxidation of the contacts on my OS and some memory, and I find that if I simply leave the thing on, it is not a problem. I am a little apprehensive, since I really don't know much about the hardware (other than the fact that the power supply is supposed to be less than terrific) and I wondered if anybody has any experience with this or knows what is likely or unlikely to happen. I have a small muffin fan that I could press into service if it is better for it to run cooler....

Thanks for any info..

Wow!! Let me start by saying that there are several misleading statements in your message. First, you can only do a memory fetch in 5 cycles only if you have the base address loaded into two page zero locations and the 8-bit index loaded in the Y register. If you don't have this situation, you need to take many cycles (instructions) to load these registers. It is very hard to write a compiler that makes good use of page zero due to the fact that you have to share it with the OS and after that there isn't much of it left for program variables. Once you start swapping page zero you lose most of its advantages. Also, if you have an array with more than 256 bytes, you can't just use the index register anyway. Enough!!

Now back to the subject of the C compiler sold by OSS. First of all, it is NOT a true compiler in that it does not generate 6502 code in the normal sense. It really generates subroutine calls which emulate something like a P-code. If you look at the BYTE magazine bench mark of Sept. 1981 and the update of Jan. 1983, you will see that there were several 6502 compilers tested, the best coming in at 14 seconds (Actually a little bit less than that if you read the Jan. issue, but its validity is in question since there weren't any controls), all of the compilers under 20 seconds were for Z80. The OSS compiler takes about 300 seconds to execute this bench mark and the Atari PASCAL (compiler) takes about 190 seconds.

Well, now the plug. There is a compiler for the Atari that generates *real* 6502 machine code. It comes on an 8K cartridge and includes an Editor (true full screen) and Monitor as well as the compiler!!!!! It also generates very good 6502 code. It executes the prime number bench mark mentioned above in 13.4, yes I said 13.4, seconds. It also compiles that bench mark in just 2, yes I said 2, seconds off the disk!!! Compare that to the compilation times of the other compilers in the bench mark (all of them take minutes, not seconds and are running off of faster disk drives than the Atari). The compile time is only about 1/4 second if you compile it from the editor buffer!!!

Now that I have you drooling at the mouth (or in total disbelief), let me tell you that you're going to have to wait to get one. It isn't scheduled to come on the market until the end of March (and you won't see any ads for it until about May). If things work out, OSS will be carrying this compiler as

well. It is called AMPL, and if you haven't guessed by now, I'm the author.
If you really can't wait till then, contact me and maybe we can work
something out.

1) Bernie Roehl sounds like a hot prospect for a 6809. It's a great
processor for 16-bits and high-level and combines the best features of
the 6800 AND 6502. However, most instructions take twice as many cycels
as they should (by 6502 standards).

The 6502 is certainly the FASTEST 8-bitter around (for simple tasks).
What I want to know is: WHY ISN'T THERE A 65000 (or whatever) descendant
of the great 6502 by now? We have 8086, z8000, and the 6800 that was
so well killed-off by the 6502 spawned 6809 and 68000.
A 16/32-bit version of the 6502 would have been great for real-time music
synthesis, at least. Was Commode-Or too busy making PETs to do anything
with their great little chip?

Too bad the hardware designers of MOS Tech's original 6502 didn't go back
to Motorola to do the 6809 properly...   mike k

I can't vouch for Atari, but at least twice I have accidentally left my
Radio Shaft CoCO on for 24 hours, with no ill effects.
Most electrical equipment reaches a "thermal equilibrium" with its
environment after an hour or so, after which nothing gets any hotter,
so if your Atari ran all evening OK it can't hurt. However:
1) Your machine is vulenerable to power line glitches, etc, all the while
it is on. Why expose it if not using it?
2) Solid-state devices don't last FOREVER, maybe only 5 to 10 years of
operating lifetime. Of course, all our toys will be obsolete before they
wear out, but....

There has been a lot of greif about the Atari 1200XL.
There seems to be a lot of confusion as to why Atari
introduced it. There are only minor improvements made
to it (64kram, 14k OS, better color, and sound circuits).
BUT IT DOES NOT HAVE ANY EXPANSION SOCKETS AND HAS ONLY TWO
JOYSTICK PORTS. Why then did atari introduce the 1200XL?

I think the reason it was introduced, was that a lot of computer
stores are dropping the Atari 400/800 computers because they
can not match the prices of K-mart, Sears, Toys-R-us, and the
discount houses. Also there seems to be alot of people out
there who think the atari is good for games but does not have
the power of an apple II or TRS-80. So why not introduce a new
computer with lots of business software and let the computer stores
have a product that is over priced like the apple and sell them
to people who want a "real" computer?

Just heard on the news that Atari is closing up all US
operations (or at least the division making video games and
home computers) and moving to "the Orient" (== Japan?)!!! It
seems 600 employees have been laid off, with the rest of its
1700 employees to follow. Wow! This could be cause for BIG
problems, depending on the full story. Does anyone know more?
Is it due to economic issues? What happens to SERVICE? PRICES?
Please someone fill us in.

According to Compute magazine, 40% of the production cost of
the new 1200 is the 64k ram chips. If that is true does that
mean it cost Atari about $150 dollars to produce it? The article
mentioned that the production cost (once it start selling) will
be lower than the either the 400 or 800. Does this mean we will
someday see the 1200 selling for about 200 ?

Recently i have been having problems with my 410.after saving a program on the tape,i find that the pinch roller has left a mark on the tape where the tape had stopped.if i try to load the program again and it fails to load first time, another mark if left on the tape where the recorder stopped,causing the loading procedure to fail every time.also rewinding the tape seems to cause marks to appear all over the place.any suggestions.(i can't afford a disc drive at the moment.

thanx

I read in a recent issue of InfoWorld that Atari has contracted with a Canadian company to produce a Logo cartridge for the Atari 400/800 and the upcoming 1200XL. The article claimed it would be available this summer sometime. I think the company is called Logo Computer Systems or something like that. It's amazing that Atari hasn't provided Logo for their computers until now, unless they thought their Pilot would fill the bill. Anybody have any more information?

Has anyone out there had experience with Intec addon memory modules
for the Atari 800? I have seen their 32K module advertised for as
little as $67, which sounds pretty good, and I was wondering
whether anyone had had problems with them. Does anyone know of a
better deal?

Subject: 3.5 inch floppy for Atari?
X-Google-Info: Converted from the original B-News header
Posted: Sat Feb 26 12:53:28 1983
Received: Sun Feb 27 02:15:18 1983
Reply-To: bryan@ihuxf.UUCP (Bryan K. DeLaney)

The following was seen in EDN magazine.

Sony and 12 other companies have agreed to a standard 3.5 inch
floppy-disk format. The agreement calls for an 80 track disk with
135 tpi density, storing .5 meg bytes per side. The disk comes
inside a 90 x 94 x34 mm cartridge.

The companies:
ATARI, Shugart Associates, Verbatim, Fuji, TDK, Athana, BASF,Memorex
3M, Wabash, Datatech, Xidex, and Sony.

Does this mean that we will, in the near future, see a new
disk drive for the Atari computers?

It isn't immediately clear to me that there "are more Z80 than 6502 systems out there." But if one extends the bounds a little to include the Atari 2600 and 5200 VCS machines, the Z80 market is a magnitute smaller than the 6502 market! The 5200 might even allow for some programmability in the future. And as far as authors of game software are concerned, I think the 6502 market is the place to be.

For anyone who cares, I have a tip for those Atari users like me who are using cassette. If you are having real headaches loading prerecorded tapes, i.e. it fails almost right away, it's very likely that it's your head alignment (assuming of course you have tried cleaning and demagnetizing). The adjustment is quite easy; looking at the 410 normally, keys toward you, the record/playback head (the center one) has a spring-loaded screw on its LEFT side. Often you can even see that the head is askew. Being extremely careful not to touch the heads, press play to bring the heads out and tighten the screw a little until the head looks straight. Try loading a tape then readjusting the screw, etc until loading perfectly. Probably the head will not go out of alignment anywhere near as quickly if you keep a finger on the active key when you press stop so the key doesn't snap up so hard (less vibration for mechanism).

Has anyone else had problems with the assembler routines at the back of the Atari Assembler Editor cartridge's manual? They claim that you can write out an object file from the assembler and then read that into memory with the Basic cartridge using CLOAD! Sorry guys, that doesn't work. I've been able to read in the raw binary from cassette that the assembler cartridge puts out, and not only is it not in the format expected by CLOAD, but it isn't in boot file format either! Only the assembler cartridge can read it back in. I'm hacking a program that can read in the object from Basic. Anyone have any similar experience? I can give the object file format to anyone interested. Of course I'm referring only to cassette-based operation.

I am looking for any technical information I can get on ATARI (or compatible) Video Game Units. Has anyone taken one apart and thoroughly examined it? Are there schematics, chip identifications, documentation? Does anyone have any information and/or experience with development systems used to create new games?

Please send replies by mail to houxd!ml or M. Lampell, HO 3K502, x6051.
